# **Chapter 1**

# ckb-next: RGB Driver for Linux and OS X

**ckb-next** is an open-source driver for Corsair keyboards and mice. It aims to bring the features of their proprietary CUE software to the Linux and Mac operating systems. This project is currently a work in progress, but it already supports much of the same functionality, including full RGB animations. More features are coming soon. Testing and bug reports are appreciated!

**Disclaimer:** ckb-next is not an official Corsair product. It is licensed under the GNU General Public License (version 2) in the hope that it will be useful, but with NO WARRANTY of any kind.

# What happened to the original ckb?

We don't know. The author of **ckb** ccMSC suddenly disappeared and hasn't showed up since July 2016. So the community around ckb decided to take the project over and continue its development. That's how **ckb-next** was created. Currently it's not rock solid and very easy to set up on newer systems but we are actively working on this. Nevertheless the project already incorporates a notable amount of fixes and patches in comparison to the original ckb.

# **Device Support**

# Keyboards:

- K65 RGB
- K70
- K70 RGB
- K70 LUX RGB
- K95\*
- K95 RGB
- Strafe
- · Strafe RGB
- = hardware playback not supported. Settings will be saved to software only.

# Mice:

- M65 RGB
- M65 PRO RGB
- Sabre RGB
- Scimitar RGB

# **Linux Installation**

Pre-made packages:

# ckb-next packages:

- Fedora 24/25, CentOS/RHEL 7 (maintained by ):
  - 'johanh/ckb' based on master branch

# ckb packages (deprecated):

- Arch Linux (maintained by ):
  - 'aur/ckb-git' based on master branch (more stable)
  - 'aur/ckb-git-latest' based on testing branch (less stable but fresher)
- Gentoo (maintained by ): emerge -av app-misc/ckb

If you are a package maintainer or want to discuss something with package maintainers let us know in the issues, so we can have an accountable and centralized communication about this. If you would like to maintain a package for your favorite distro/OS, please let us know as well.

#### Preparation:

ckb-next requires Qt5 (Qt 5.6 recommened for OS X), libudev, zlib, gcc, g++, and glibc.

- **Ubuntu**: sudo apt-get install build-essential libudev-dev qt5-default zlib1g-dev libappindicator-dev
- Fedora: sudo dnf install zlib-devel qt5-qtbase-devel libgudev-devel libappindicator-de systemd-devel gcc-c++
- Arch: sudo pacman -S base-devel qt5-base zlib
- Other distros: Look for qt5 or libqt5\*-devel

Note: If you build your own kernels, ckb-next requires the uinput flag to be enabled. It is located in Device Drivers -> Input Device Support -> Miscellaneous devices -> User level driver support. If you don't know what this means, you can ignore this.

#### Installing:

You can download ckb-next using the "Download zip" option on the right. Extract it and open the ckb-master directory. The easiest way to install ckb is to double-click the quickinstall script and run it in a Terminal. It will attempt to build ckb and then ask if you'd like to install/run the application. If the build doesn't succeed, or if you'd like to compile ckb manually, see https://github.com/ccMSC/ckb/blob/master/BUILD.md "BUILD.md" for instructions.

# **Upgrading:**

To install a new version of ckb, or to reinstall the same version, first delete the ckb-master directory and the zip file from your previous download. Then download the source code again and re-run quickinstall. The script will automatically replace the previous installation. You may need to reboot afterward.

# Uninstalling:

First, stop the ckb-daemon service and remove the service file.

- If you have systemd (Ubuntu versions starting with 15.04): "sudo systemctl stop ckb-daemon sudo rm -f /usr/lib/systemd/system/ckb-daemon.service "
- If you have Upstart (Ubuntu versions earlier than 15.04): " sudo service ckb-daemon stop sudo rm -f /etc/init/ckb-daemon.conf "
- If you have OpenRC: "sudo rc-service ckb-daemon stop sudo rc-update del ckb-daemon default sudo rm -f/etc/init.d/ckb-daemon"
- If you're not sure, re-run thequickinstallscript and proceed to the service installation. The script will saySystem service: Upstart detectedorSystem service: systemd detected. Please be aware that OpenRC is currently not detected automatically.

Afterward, remove the applications and related files: "' sudo rm -f /usr/bin/ckb /usr/bin/ckb-daemon /usr/share/applications/ckb.desktop /usr/share/icons/hicolor/512x512/apps/ckb.png sudo rm -rf /usr/lib/ckb-animations "'

Before https://github.com/mattanger/ckb-next/commit/f347e60df211c60452f95084b6c46dc4ec5f42 animations were located elsewhere, try removing them as well: "sudo rm -rf /usr/bin/ckb-animations"

# OS X/macOS Installation

# Binary download:

The latest OS X/macOS binary can be downloaded here: https://github.com/mattanger/ckb-next/releases/late

Click on ckb.pkg under the Downloads section. This is an automated installer which will set up the driver for you. After it's finished, open ckb.app (it will be installed to your Applications directory) to get started.

#### **Building from source:**

Install the latest version of Xcode from the App Store. Open Xcode, accept the license agreement, and wait for it to install any additional components (if necessary). When you see the "Welcome to Xcode" screen, the setup is finished and you can close the app. Then install Xcode Command Line Tools package issuing xcode-select --install in a Terminal app. Afterwards install Qt5 from here: http://www.qt.-io/download-open-source/

The easiest way to build the driver is with the <code>quickinstall</code> script, which is present in the <code>ckb-master</code> folder. Double-click on <code>quickinstall</code> and it will compile the app for you, then ask if you'd like to install it system-wide. If the build fails for any reason, or if you'd like to compile manually, see <a href="https://github.com/ccMSC/ckb/blob/master/-BUILD.md">https://github.com/ccMSC/ckb/blob/master/-BUILD.md</a>"BUILD.md".

# Upgrading (binary):

Download the latest ckb.pkg, run the installer, and reboot. The newly-installed driver will replace the old one.

# Upgrading (source):

Remove the existing ckb-master directory and zip file. Re-download the source code and run the quickinstall script again. The script will automatically replace the previous installation. You may need to reboot afterward.

### Uninstalling:

Drag ckb.app into the trash. If the system service file isn't cleaned up automatically, you can find it and remove it here: /Library/LaunchDaemons/com.ckb.daemon.plist.

# **Usage**

The user interface is still a work in progress.

# Major features:

- · Control multiple devices independently
- · United States and European keyboard layouts
- · Customizable key bindings
- · Per-key lighting and animation
- · Reactive lighting
- Multiple profiles/modes with hardware save function
- · Adjustable mouse DPI with ability to change DPI on button press
- Key macros (G-Keys also); Have a look at https://youtu.be/qhrKP03\_NrM for a short video tutorial
- · Key macro delays: Handle delays between keystrokes when playing a macro

Closing ckb will actually minimize it to the system tray. Use the Quit option from the tray icon or the settings screen to exit the application.

# Roadmap (roughly in order)

- · v0.3 release:
- · Ability to store profiles separately from devices, import/export them
- · More functions for the Win Lock key
- · v0.4 release:

- · Ability to import CUE profiles
- · Ability to tie profiles to which application has focus
- v0.5 release:
- · Key combos
- · Timers?
- · v1.0 release:
- OSD? (Not sure if this can actually be done)
- · Extra settings?
- ????

# **Troubleshooting**

#### Linux

If you have problems connecting the device to your system (device doesn't respond, ckb-daemon doesn't recognize or can't connect it) and/or you experience long boot times when using the keyboard, try adding the following to your kernel's cmdline:

- K65 RGB: usbhid.quirks=0x1B1C:0x1B17:0x20000408
- K70: usbhid.quirks=0x1B1C:0x1B09:0x0x20000408
- K70 RGB: usbhid.quirks=0x1B1C:0x1B13:0x20000408
- K95: usbhid.quirks=0x1B1C:0x1B08:0x20000408
- K95 RGB: usbhid.quirks=0x1B1C:0x1B11:0x20000408
- Strafe: usbhid.quirks=0x1B1C:0x1B15:0x20000408
- Strafe RGB: usbhid.quirks=0x1B1C:0x1B20:0x20000408
- M65 RGB: usbhid.quirks=0x1B1C:0x1B12:0x20000408
- Sabre RGB Optical: usbhid.quirks=0x1B1C:0x1B14:0x20000408
- Sabre RGB Laser: usbhid.quirks=0x1B1C:0x1B19:0x20000408
- Scimitar RGB: usbhid.quirks=0x1B1C:0x1B1E:0x20000408

For instructions on adding cmdline parameters in Ubuntu, see https://wiki.ubuntu.com/Kernel/-KernelBootParameters

If you have multiple devices, combine them with commas, starting after the =. For instance, for K70 RGB + M65 RGB: usbhid.quirks=0x1B1C:0x1B13:0x20000408, 0x1B1C:0x1B12:0x20000408

If it still doesn't work, try replacing  $0 \times 20000408$  with  $0 \times 4$ . Note that this will cause the kernel driver to ignore the device(s) completely, so you need to ensure ckb-daemon is running at boot or else you'll have no input. This will not work if you are using full-disk encryption.

If you see **GLib** critical errors like 'GLib-GObject-CRITICAL \*\*: g\_type\_add\_interface\_static: assertion 'G\_TYPE\_-IS\_INSTANTIATABLE (instance\_type)' failed' and you are using:

- Qt 5.8 and newer, remove your Qt configuration files and restart the ckb GUI. Also watch out for different style
  overridings in dotfiles under ~/ generated by Qt automatically, remove them as well.
- Qt 5.7 and lower, install qt5ct package on Arch Linux (find a similar one for your distribution). That's all. This is a known Qt bug. It happened because Qt did not ship required GTK files.

If you're using **Unity** and the tray icon doesn't appear correctly, run sudo apt-get install libappindicator-dev. Then reinstall ckb.

#### OS X/macOS

- \*\*"ckb.pkg" can't be opened because it is from an unidentified developer\*\* Open System Preferences
  > Security & Privacy > General and click Open Anyway.
- Modifier keys (Shift, Ctrl, etc.) are not rebound correctly ckb does not recognize modifier keys rebound from System Preferences. You can rebind them again within the application.
- \*\*~ key prints §±\*\* Check your keyboard layout on ckb's Settings screen. Choose the layout that matches your physical keyboard.
- Compile problems Can usually be resolved by rebooting your computer and/or reinstalling Qt. Make sure that Xcode works on its own. If a compile fails, delete the ckb-master directory as well as any automatically generated build-ckb folders and try again from a new download.
- Scroll wheel does not scroll As of #c3474d2 it's now possible to disable scroll acceleration from the GUI. You can access it under "OSX tweaks" in the "More settings" screen. Once disabled, the scroll wheel should behave consistently.

#### General

Please ensure your keyboard firmware is up to date. If you've just bought the keyboard, connect it to a Windows computer first and update the firmware from Corsair's official utility.

Before reporting an issue, connect your keyboard to a Windows computer and see if the problem still occurs. If it does, contact Corsair. Additionally, please check the Corsair user forums to see if your issue has been reported by other users. If so, try their solutions first.

#### Common issues:

- Problem: ckb says "No devices connected" or "Driver inactive"
- **Solution:** Try rebooting the computer and/or reinstalling ckb. Try removing the keyboard and plugging it back in. If the error doesn't go away, try the following:
- Problem: Keyboard doesn't work in BIOS, doesn't work at boot
- **Solution:** Some BIOSes have trouble communicating with the keyboard. They may prevent the keyboard from working correctly in the operating system as well. First, try booting the OS *without* the keyboard attached, and plug the keyboard in after logging in. If the keyboard works after the computer is running but does not work at boot, you may need to use the keyboard's BIOS mode option.
- BIOS mode can be activated using the poll rate switch at the back of the keyboard. Slide it all the way to the position marked "BIOS". You should see the scroll lock light blinking to indicate that it is on. (Note: Unfortunately, this has its own problems see Known Issues. You may need to activate BIOS mode when booting the computer and deactivate it after logging in).
- Problem: Keyboard isn't detected when plugged in, even if driver is already running
- Solution: Try moving to a different USB port. Be sure to follow Corsair's USB connection requirements. Note that the keyboard does not work with some USB3 controllers if you have problems with USB3 ports, try USB2 instead. If you have any USB hubs on hand, try those as well. You may also have success sliding the poll switch back and forth a few times.

# Reporting issues

If you have a problem that you can't solve (and it isn't mentioned in the Known Issues section below), you can report it on the GitHub issue tracker. Before opening a new issue, please check to see if someone else has reported your problem already - if so, feel free to leave a comment there.

# **Known issues**

- Using the keyboard in BIOS mode prevents the media keys (including mute and volume wheel), as well as the K95's G-keys from working. This is a hardware limitation.
- The tray icon doesn't appear in some desktop environments. This is a known Qt bug. If you can't see the icon, reopen ckb to bring the window back.
- When starting the driver manually, the Terminal window sometimes gets spammed with enter keys. You can stop it by unplugging and replugging the keyboard or by moving the poll rate switch.
- When stopping the driver manually, the keyboard sometimes stops working completely. You can reconnect it by moving the poll rate switch.

# Contributing

You can contribute to the project by opening a pull request. It's best if you base your changes off of the testing branch as opposed to the master, because the pull request will be merged there first. If you'd like to contribute but don't know what you can do, take a look at the issue tracker and see if any features/problems are still unresolved. Feel free to ask if you'd like some ideas.

ckb-next: RGB Driver for Linux and OS X

# **Chapter 2**

# **Building ckb**

#### Linux

You can build the project by running ./qmake-auto && make in a Terminal inside the ckb-master directory. The binaries will be placed in a new bin directory assuming they compile successfully. If you get a No suitable qmake found error, make sure Qt5 is installed and up to date. You may have to invoke qmake manually, then run make on its own. If you have Qt Creator installed, you can open ckb.pro (when asked to configure the project, make sure "Desktop" is checked) and use Build > Build Project "ckb" (Ctrl+B) to build the application instead.

#### Running as a service:

First copy the binary and the service files to their system directories:

- Upstart (Ubuntu, prior to 15.04): sudo cp -R bin/\* /usr/bin && sudo cp service/upstart/ckb-daemon conf /etc/init
- Systemd (Ubuntu 15.04 and later): sudo cp -R bin/\* /usr/bin && sudo cp service/systemd/ckb-daem service /usr/lib/systemd/system
- OpenRC: sudo cp -R bin/\* /usr/bin && sudo cp service/openrc/ckb-daemon /etc/init.d/

To launch the driver and enable it at start-up:

- Upstart: sudo service ckb-daemon start
- Systemd: sudo systemctl start ckb-daemon && sudo systemctl enable ckb-daemon
- OpenRC: sudo rc-service ckb-daemon start && sudo rc-update add ckb-daemon default

Open the bin directory and double-click on ckb to launch the user interface. If you want to run it at login, add ckb —background to your Startup Applications.

# **Running manually:**

Open the bin directory in a Terminal and run sudo. /ckb-daemon to start the driver. To start the user interface, run./ckb. Running the driver manually may be useful for testing/debugging purposes, but you must leave the terminal window open and you'll have to re-run it at every reboot, so installing it as a service is the best long-term solution.

10 Building ckb

# OSX

Open ckb.pro in Qt Creator. You should be prompted to configure the project (make sure the "Desktop" configuration is selected and not iOS). Once it's finished loading, press Cmd+B or select Build > Build Project "ckb" from the menu bar. When it's done, you should see a newly-created <math>ckb.app in the project directory. Exit Qt Creator.

Alternatively, open a Terminal in the ckb-master directory and run ./qmake-auto && make. It will detect Qt automatically if you installed it to one of the standard locations. You should see a newly created ckb.app if the build is successful.

# Running as a service:

Copy ckb.app to your Applications folder. Copy the file <code>'service/launchd/com.ckb.daemon.plist'</code> to your computer's <code>/Library/LaunchDaemons</code> folder (you can get to it by pressing <code>Cmd+Shift+G</code> in Finder and typing the location). Then open a Terminal and run the following commands to launch the driver:

" sudo chown root:wheel /Library/LaunchDaemons/com.ckb.daemon.plist sudo chmod 0700 /Library/LaunchDaemons/com.ckb.daemon.plist sudo launchctl load /Library/LaunchDaemons/com.ckb.daemon.plist "

After you're done, open ckb.app to launch the user interface.

# **Running manually:**

Open a Terminal in the ckb directory and run <code>sudo ckb.app/Contents/Resources/ckb-daemon</code> to start the driver. Open <code>ckb.app</code> to start the user interface. Note that you must leave the terminal window open and must re-launch the driver at every boot if you choose this; installing as a service is the better long term solution.

# **Chapter 3**

# cbk Improvements Roadmap

# Short term plan

- merge existing PR submitted to original ckb repo
- · Contact other developers interested in collaboration on a new and improved version of ckb
- Figure out the issues relating to MacOS Sierra and other version
- · Device support:
  - Determine which will need support other than just USB id additions
- Address existing bugs. Not help requests.

cbk l	Improv	ements	Roadma	ľ
-------	--------	--------	--------	---

# **Chapter 4**

# **DAEMON**

The daemon provides devices at  $\dev/input/ckb*$ , where \* is the device number, starting at 1. Up to 9 devices may be connected at once and controlled independently. The daemon additionally provides  $\dev/input/ckb0$ , which stores driver information.

Mac note: The devices on OSX are located at /var/run/ckb\* and not /dev/input/ckb\*. So wherever you see /dev/input in this document, replace it with /var/run.

/dev/input/ckb0 contains the following files:

- connected: A list of all connected devices, one per line. Each line contains a device path followed by the device's serial number and its description.
- pid: The process identifier of the daemon.
- version: The daemon version.

Other ckb\* devices contain the following:

- cmd: Keyboard controller.
- notify0: Keyboard notifications.
- features: Device features.
- fwversion: Device firmware version (not present on all devices).
- model: Device description/model.
- pollrate: Poll rate in milliseconds (not present on all devices).
- serial: Device serial number. model and serial will match the info found in ckb0/connected

# **Commands**

The /dev/input/ckb\*/cmd nodes accept input in the form of text commands. They are normally accessible to all users on the system (see Security section). Commands should be given in the following format: [mode < n>] command1 [parameter1] [command2] [parameter2] [command3] [parameter3] ...

In a terminal shell, you can do this like echo mycommand > /dev/input/ckb1/cmd. Programmatically, you can open and write them as regular files. When programming, you must append a newline character and flush the output before your command(s) will actually be read.

The mode parameter is used to group settings. Most (but not all) settings are mode-specific; that is, changing mode 1 will not affect mode 2. By default, all commands affect the current mode. Use mode < n > mode < n >

14 DAEMON

When plugged in, all devices start in hardware-controlled mode (also known as idle mode) and will not respond to commands. Before issuing any other commands, write active to the command node, like echo active > /dev/input/ckb1/cmd. To put the device back into hardware mode, issue the idle command.

#### **Features**

The features node describes features supported by the device, which may not be present on all devices. The first two words in the features node are always <vendor> <model>, like corsair k70. After that, any of the following features may appear:

- adjrate: Device supports adjustable poll rate.
- bind: Device supports key rebinding.
- fwupdate: Device supports firmware updates.
- fwversion: Device has a detectable firmware version (stored in the fwversion node).
- notify: Device supports key notifications.
- pollrate: Device has a detectable poll rate (stored in the pollrate node).
- rgb: Device supports RGB lighting.

# **Keyboard layout**

The driver has no concept of keyboard layouts; all keys are referred to by their English names regardless of the underlying hardware. This means that, for instance, in an AZERTY layout the q key in ckb-daemon corresponds to A on the physical keyboard. Note that on UK/european (ISO) layouts, the backslash key (beside left shift) is called bslash\_iso, while bslash refers to the backslash on the US keyboard. The key next to Enter on the ISO keyboard is known as hash. See src/ckb-daemon/keymap.c for the full table of supported keys.

For technical reasons, the OSX driver may swap the bslash\_iso and grave keys if the keyboard layout is not set correctly. To compensate for this, write layout iso or layout ansi to the command node.

#### Poll rate

A device's current poll rate can be read from its pollrate node, assuming it has one. Keyboards have a hardware switch to control poll rate and cannot be adjusted via software. However, mice have a software-controlled poll rate. You can change it by issuing pollrate <interval> to the command node, where interval is the time in milliseconds. Valid poll rates are 1, 2, 4, and 8.

# **Profiles and modes**

Each mode has its own independent binding and lighting setup. When the daemon starts or a keyboard is plugged in, the profile will be loaded from the hardware. By default, all commands will update the currently selected mode. The mode < n > command may be used to change the settings for a different mode. Up to 6 modes are available. Each keyboard has one profile, which may be given a name. Mode 1 may be saved to the device hardware, or modes 1-3 in the case of the K95. Modes 4 through 6 are software-only. Profile management commands are as follows:

- profilename <name> sets the profile's name. The name must be written without spaces; to add a space, use %20.
- $\bullet$  name <name> sets the current mode's name. Use mode <n> name <name> to set a different mode's name.

- profileid <guid> [<modification>] sets a profile's ID. The GUID must be written in registry format, like {12345678-ABCD-EF01-2345-6789ABCDEF01}. The optional modification number must be written with 8 hex digits, like ABCDEF01.
- id <guid> [<modification>] sets a mode's ID.
- mode <n> switch switches the keyboard to mode N. If the mode does not exist, it will be created with a blank ID, black lighting, and default bindings.
- hwload loads the RGB profile from the hardware. Key bindings and non-hardware RGB modes are unaffected.
- hwsave saves the RGB profile to the hardware.
- erase erases the current mode, resetting its lighting and bindings. Use mode <n> erase to erase a different mode.
- eraseprofile erases the entire profile, deleting its name, ID, and all of its modes.

### **Examples:**

- profilename My%20Profile mode 1 name Mode%201 mode 2 name Mode%202 mode 3 name Mode%203 will name the profile "My Profile" and name modes 1-3 "Mode 1", "Mode 2", and "Mode 3".
- eraseprofile hwload resets the entire profile to its hardware settings.

#### **LED** commands

The backlighting is controlled by the rgb commands.

- rgb <RRGGBB> sets the entire keyboard to the color specified by the hex constant RRGGBB.
- rgb <key>:<RRGGBB> sets the specified key to the specified hex color.

### **Examples:**

- rgb ffffff makes the whole keyboard white.
- rgb 000000 makes the whole keyboard black.
- rgb esc:ff0000 sets the Esc key red but leaves the rest of the keyboard unchanged.

Multiple keys may be changed to one color when separated with commas, for instance:

• rgb w,a,s,d:0000ff sets the WASD keys to blue.

Additionally, multiple commands may be combined into one, for instance:

• rgb ffffff esc:ff0000 w,a,s,d:0000ff sets the Esc key red, the WASD keys blue, and the rest of the keyboard white (note the lack of a key name before ffffff, implying the whole keyboard is to be set).

By default, the controller runs at 30 FPS, meaning that attempts to animate the LEDs faster than that will be ignored. If you wish to change it, send the command fps < n>. The maximum frame rate is 60.

For devices running in 512-color mode, color dithering can be enabled by sending the command  $dither\ 1$ . The command  $dither\ 0$  disables dithering.

16 DAEMON

### **Indicators**

The indicator LEDs (Num Lock, Caps Lock, Scroll Lock) are controlled with the  $\pm$  commands.

- ioff <led> turns an indicator off permanently. Valid LED names are num, caps, and scroll.
- ion <led> turns an indicator on permanently.
- iauto <led> turns an indicator off or on automatically (default behavior).

### Binding keys

Keys may be rebound through use of the bind commands. Binding is a 1-to-1 operation that translates one keypress to a different keypress regardless of circumstance.

- bind <key1>:<key2> remaps key1 to key2.
- unbind <key> unbinds a key, causing it to lose all function.
- rebind <key> resets a key, returning it to its default binding.

### **Examples:**

- bind g1:esc makes G1 become an alternate Esc key (the actual Esc key is not changed).
- bind caps:tab tab:caps switches the functions of the Tab and Caps Lock keys.
- unbind lwin rwin disables both Windows keys, even without using the keyboard's Windows Lock function.
- rebind all resets the whole keyboard to its default bindings.

# **Key macros**

Macros are a more advanced form of key binding, controlled with the macro command.

- macro <keys>:<command> binds a key combination to a command, where the command is a series
  of key presses. To combine keys, separate them with +; for instance, lctrl+a binds a macro to (left) Ctrl+A.
  In the command field, enter +<key> to trigger a key down or -<key> to trigger a key up. To simulate a
  key press, use +<key>, -<key>.
- macro <keys>:clear clears commands associated with a key combination. Only one macro may be assigned per combination; assigning a second one will overwrite the first.
- macro clear clears all macros.

# **Examples:**

- macro g1:+lctrl,+a,-a,-lctrl triggers a Ctrl+A when G1 is pressed.
- macro g2+g3:+lalt,+f4,-f4,-lalt triggers an Alt+F4 when G2 and G3 are pressed simultaneously.

Assigning a macro to a key will cause its binding to be ignored; for instance, macro a:+b, -b will cause A to generate a B character regardless of its binding. However, macro lctrl+a:+b, -b will cause A to generate a B only when Ctrl is also held down.

### Macro playback delay

There are two types of playback delay that can be set with macros; global and local. Setting a *global delay* value introduces a time delay between events during macro execution or playback. *Local delay* allows setting the delay after an individual event, overriding the global delay value for that event. Thus global delay can be used to set the overall playback speed of macros and local delays can be used to tune individual events within a macro.

All delay values are specified in microseconds (us) and are positive values from 0 to UINT\_MAX - 1. This means delays range from 0 to just over 1 hour (4,294,967,294us, 4,294 seconds, 71 minutes, or 1.19 hours). A value of zero (0) represents no delay between actions.

### Global macro delay (default delay)

Global delay allows macro playback speed to be changed. It sets the time between (actually after) each recorded macro event. If global delay is set to 1 microsecond then a 1 ms delay will follow each individual macro event when the macro is triggered.

The *global delay* is set with the ckb-daemon's existing (in testing branch) delay command followed by an unsigned integer representing the number of microseconds to wait after each macro action and before the next.

Global delay can also be set to on which maintains backwards compatibility with the current development of ckb-daemon for long macro playback. That is, setting the global delay to on introduces a 30us and a 100us delay based on the macro's length during playback.

**NOTE**: This setting also introduces a delay after the last macro action. This functionality exists in the current testing branch and was left as-is. It is still to be determined if this is a bug or a feature.

### **Examples:**

- delay 1000 sets a 1,000us delay between action playback.
- delay on sets long macro delay; 30us for actions between 20 and 200, 100us for actions > 200.
- delay off sets no delay (same as 0).
- delay 0 sets no delay (same as off).
- delay spearmint-potato is invalid input, sets no delay (same as off).

### Local macro delay (keystroke delay)

Local Delay allows each macro action to have a post-action delay associated with it. This allows a macro to vary it's playback speed for each event. If no local delay is specified for a macro action, then the global delay (above) is used. All delay values are in microsecods (us) as with the global delay setting.

### \*\*\*Examples:\*\*\*

- macro g5:+d,-d,+e=5000,-e,+1,-l=10000,+a,-a,+y,-y=1000000,+enter,-enter define a macro for g5 with a 5,000us delay between the e down and e up actions. A 1,000us delay between 1 up and a down, a delay of one second (1,000,000us) after y up and before enter, and the global delay for all other actions.
- macro g5:+d,-d=0 use default delay between d down and d up and no delay (0us) after d up. This removes the noted feature/bug (above) where the last action has a trailing delay associated with it.

# **DPI** and mouse settings

DPI settings are stored in a bank. They are controlled with the dpi command.

- dpi <stage>:<x>,<y> sets the DPI for a given stage to x by y. Valid stages are 0 through 5. In hardware, 1 is the first (lowest) stage and 5 is the highest. Stage 0 is used for Sniper mode.
- dpi <stage>:<xy> sets both X and Y.

18 DAEMON

- dpi <stage>:off disables a DPI stage.
- dpisel <stage> sets the current stage selection.

In order to change the mouse's current DPI, first update one of the stages with the value you want, then select that stage. For instance:

• dpi 1:1000 dpisel 1 sets the current DPI to 1000x1000.

### Additional mouse settings:

- lift <height> sets the lift height, from 1 (lowest) to 5 (highest)
- snap <on|off> enables or disables Angle Snap.

### **Notifications**

The keyboard can be configured to generate user-readable notifications on keypress events. These are controlled with the notify commands. In order to see events, read from /dev/input/ckb\*/notify0. In a terminal, you can do this like cat /dev/input/ckb1/notify0. Programmatically, you can open it for reading like a regular file.

Note that the file can only reliably be read by one application: if you try to open it in two different programs, they may both fail to get data. Data will be buffered as long as no programs are reading, so you will receive all unread notifications as soon as you open the file. If you'd like to read notifications from two separate applications, send the command notifyon < n > to the keyboard you wish to receive notifications from, where N is a number between 1 and 9. If /dev/input/ckb\*/notify< n > does not already exist, it will be created, and you can read notifications from there without disrupting any other program. To close a notification node, send notifyoff < n >.

notify0 is always open and will not be affected by notifyon/notifyoff commands. By default, all notifications are printed to notify0. To print output to a different node, prefix your command with @<node>.

Notifications are printed with one notification per line. Commands are as follows:

- notify <key>:on or simply notify <key> enables notifications for a key. Each key will generate two notifications: key +<key> when the key is pressed, and key -<key> when it is released.
- notify <key>:off turns notifications off for a key.

### **Examples:**

- notify w a s d sends notifications whenever W, A, S, or D is pressed.
- notify g1 g2 g3 g4 g5 g6 g7 g8 g9 g10 g11 g12 g13 g14 g15 g16 g17 g18 mr m1 m2 m3 light lock prints a notification whenever a non-standard key is pressed.
- notify all:off turns all key notifications off.
- @5 notify esc prints Esc key notifications to notify5.

### Indicator notifications

You can also choose to receive notifications for the indicator LEDs by using the inotify command. For instance, inotify caps: on or simply inotify caps will print notifications whenever the Caps Lock LED is toggled. The notifications will read i +caps when the light is turned on and i -caps when it is turned off. It is also possible to toggle all indicators at once using inotify all or inotify all:off.

Like key notifications, indicator notifications are not affected by bindings, nor by the ion, ioff, or iauto commands. The notifications will reflect the state of the LEDs as seen be the event device.

## **Getting parameters**

Parameters can be retrieved using the get command. The data will be sent out as a notification. Generally, the syntax to get the data associated with a command is get :<command> (note the colon), and the associated data will be returned in the form of <command> <data>. The following data may be gotten:

- get :mode returns the current mode in the form of a switch command. (Note: Do not use this in a line containing a mode command or it will return the mode that you selected, rather than the keyboard's current mode.)
- get :name returns the current mode's name in the form of mode <n> name <name>. To see the name of another mode, use mode <n> get :name. The name is URL-encoded; spaces are written as %20. The name may be truncated, so name <some long string> get :name may return something shorter than what was entered.
- get :profilename returns the profile's name, in the form of profilename <name>. As above, it is URL-encoded and may be truncated.
- get :hwname and get :hwprofilename return the same thing except taken from the current hardware profile instead of the in-memory profile. The output is identical but will read hwname instead of name and hwprofilename instead of profilename.
- get :id returns the current mode's ID and modification number in the form of mode <n> id <guid> <modification>.
- get :profileid returns the current profile's ID and modification number in the form of profileid <quid> <modification>.
- get :hwid and get :hwprofileid return the same thing except from the current hardware profile/mode. As before, the ouput will be the same but with hwid and hwprofileid instead of id and profileid.
- get :rgb returns an rgb command equivalent to the current RGB state.
- get :hwrgb does the same thing, but retrieves the colors currently stored in the hardware profile. The output will say hwrgb instead of rgb.
- $\operatorname{get}$  : dpi returns a dpi command equivalent to the current DPI bank.
- get :dpisel returns a dpisel command for the currently-selected DPI stage.
- get :lift returns a lift command for the current lift height.
- get :snap returns the current angle snap status.
- get :hwdpi, get :hwdpisel, get :hwlift, and get :hwsnap return the same properties, but for the current hardware profile.
- get :keys and get :i return the current keypress status and indicator status, respectively. They will indicate all currently pressed keys and all currently active indicators, like key +enter and i +num.

Like notify, you must prefix your command with @<node> to get data printed to a node other than notify0.

20 DAEMON

### Firmware updates

**WARNING:** Improper use of fwupdate may brick your device; use this command *at your own risk*. I accept no responsibility for broken keyboards.

The latest firmware versions and their URLs can be found in the FIRMWARE document. To update your keyboard's firmware, first extract the contents of the zip file and then issue the command fwupdate /path/to/fw/file.bin to the keyboard you wish to update. The path name must be absolute and must not include spaces. If it succeeded, you should see fwupdate < path> ok logged to the keyboard's notification node and then the device will disconnect and reconnect. If you see fwupdate < path> invalid it means that the firmware file was not valid for the device; more info may be available in the daemon's stdout. If you see fwupdate < path> fail it means that the file was valid but the update failed at a hardware level. The keyboard may disconnect/reconnect anyway or it may remain in operation.

When the device reconnects you should see the new firmware version in its fwversion node; if you see 0000 instead it means that the keyboard did not update successfully and will need another fwupdate command in order to function again. If the update fails repeatedly, try connecting the keyboard to a Windows PC and using the official firmware update in CUE.

### Restart

Because sometimes the communication between the daemon and the keyboard is corrupted after resuming from standby or suspend, a restart function is implemented. It first calls the quit() funtion, then it calls main() again with the original parameter list.

There are two ways to restart the daemon:

- send the string "restart some-description-as-one-word" to the cmd-pipe (normally /dev/input/ckb1/cmd or /dev/input/ckb2/cmd, depending on what device gets which ID.
- send SIGUSR1 to the daemon process (as root).

Later on, there may be a user interface in the client for the first method.

### Security

By default, all of the <code>ckb\*</code> nodes may be accessed by any user. For most single-user systems this should not present any security issues, since only one person will have access to the computer anyway. However, if you'd like to restrict the users that can write to the <code>cmd</code> nodes or read from the <code>notify</code> nodes, you can specify the --gid=<group> option at start up. For instance, on most systems you could run <code>ckb-daemon --gid=1000</code> to make them accessible only by the system's primary user. <code>ckb-daemon must</code> still be run as root, regardless of which <code>gid</code> you specify. The <code>gid</code> option may be set only at startup and cannot be changed while the daemon is running.

The daemon additionally supports a -nonotify option to disable key notifications, to prevent unauthorized programs from logging key input. Note that this will interfere with some of ckb's abilities. It is also highly unlikely to increase security unless you are using the program in a stripped down terminal environment without Xorg. For most use cases there are many other (more likely) ways that a keylogger program could compromise your system. Nevertheless, the option is provided for the sake of paranoia. If you'd like to disable key rebinding as well, launch the daemon with -nobind. -nobind implies -nonotify, so notifications will also be disabled. As with -qid, these options must be set at startup and cannot be changed while the daemon is running.

# **Chapter 5**

# **Todo List**

### Global \_usbsend (usbdevice \*kb, const uchar \*messages, int count, const char \*file, int line)

A lot of different conditions are combined in this code. Don't think, it is good in every combination...

Check whether this is the same in the macOS variant. It is not dramatic, but if errors occur, it can certainly irritate the devices completely if they receive incomplete data streams. Do we have errors with the messages "Wrote YY bytes (expected 64)" in the system logs? If not, we do not need to look any further.

### Global closeusb (usbdevice \*kb)

What is not yet comprehensible is the call to updateconnected() BEFORE os\_closeusb(). Should that be in the other sequence? Or is updateconnected() not displaying the connected usb devices, but the representation which uinput devices are loaded? Questions about questions ...

### Global devmain (usbdevice \*kb)

Hope to find the need for dmutex usage later.

Should this function be declared as pthread\_t\* function, because of the defintion of pthread-create? But void\* works also...

readcmd() gets a line, not lines. Have a look on that later.

Is the condition IS CONNECTED valid? What functions change the condition for the macro?

## Global get\_vtable (short vendor, short product)

Is the last point really a good decision and always correct?

### Global inputupdate keys (usbdevice \*kb)

If we want to get all keys typed while a macro is played, add the code for it here.

### Global macro\_pt\_enqueue ()

find a better exit strategy if no more mem available.

### Global os inputmain (void \*context)

This function is a collection of many tasks. It should be divided into several sub-functions for the sake of greater convenience:

### Global os resetusb (usbdevice \*kb, const char \*file, int line)

it seems that no one wants to try the reset again. But I'v seen it somewhere...

### Global os setupusb (usbdevice \*kb)

in these modules a pullrequest is outstanding

## Global os\_usbsend (usbdevice \*kb, const uchar \*out\_msg, int is\_recv, const char \*file, int line)

Since the handling of endpoints has already led to problems elsewhere, this implementation is extremely hardware-dependent and critical!

Eg. the new keyboard K95PLATINUMRGB has a version number significantly less than 2.0 - will it run with this implementation?

22 Todo List

### Global product str (short product)

There are macros defined in usb.h to detect all the combinations below. the only difference is the parameter: The macros need the *kb\**, product\_str() needs the *product ID* 

### Global revertusb (usbdevice \*kb)

Why is this useful? Are there problems seen with deactivating a device with older fw-version??? Why isn't this an error indicating reason and we return success (0)?

The return value of nk95cmd() is ignored (but sending the ioctl may produce an error and \_nk95\_cmd will indicate this), instead revertusb() returns success in any case.

### **Global udevthread**

These two thread vasriables seem to be unused: usbtread, udevthread

### **Global udevthread**

These two thread vasriables seem to be unused: usbtread, udevthread

# Global usb\_add\_device (struct udev\_device \*dev)

So why the hell not a transformation between the string and the short presentation? Lets check if the string representation is used elsewhere.

## Global usb\_tryreset (usbdevice \*kb)

Why does usb\_tryreset() hide the information returned from resetusb()? Isn't it needed by the callers?

### Global usbmain ()

Why isn't missing of uinput a fatal error?

lae. here the work has to go on...

### **Global usbmutex**

We should have a look why this mutex is never used.

# **Functions**

- int \_start\_dev (usbdevice \*kb, int makeactive)
- int start\_dev (usbdevice \*kb, int makeactive)

### **Variables**

• int hwload mode = 1

hwload\_mode = 1 means read hardware once. should be enough

· usbdevice keyboard [9]

remember all usb devices. Needed for closeusb().

- pthread mutex t devlistmutex = PTHREAD MUTEX INITIALIZER
- pthread\_mutex\_t devmutex [9] = { [0 ... 9 -1] = PTHREAD\_MUTEX\_INITIALIZER }

Mutex for handling the usbdevice structure.

pthread\_mutex\_t inputmutex [9] = { [0 ... 9 -1] = PTHREAD\_MUTEX\_INITIALIZER }
 Mutex for dealing with usb input frames.

pthread\_mutex\_t macromutex [9] = { [0 ... 9 -1] = PTHREAD\_MUTEX\_INITIALIZER }
 Protecting macros against lightning: Both use usb send.

pthread\_mutex\_t macromutex2 [9] = { [0 ... 9 -1] = PTHREAD\_MUTEX\_INITIALIZER }

Protecting the single link list of threads and the macrovar.

pthread\_cond\_t macrovar [9] = { [0 ... 9 -1] = PTHREAD\_COND\_INITIALIZER }

This variable is used to stop and wakeup all macro threads which have to wait.

### 9.7.1 Function Documentation

9.7.1.1 int \_start\_dev ( usbdevice \* kb, int makeactive )

start dev get fw-info and pollrate; if available, install new firmware; get all hardware profiles.

### **Parameters**

kb	the normal kb pointer to the usbdevice. Is also valid for mice.
makeactive	if set to 1, activate the device via setactive()

### Returns

0 if success, other else

• This hacker code is tricky in mutliple aspects. What it means is:

if hwload mode == 0: just set pollrate to 0 and clear features in the bottom lines of the if-block.

if hwload\_mode == 1: if the device has FEAT\_HWLOAD active, call getfwersion(). If it returns true, there was an error while detecting fw-version. Put error message, reset FEAT\_HWLOAD and finalize as above.

if hwload\_mode == 2: if the device has FEAT\_HWLOAD active, call getfwersion(). If it returns true, there was an error while detecting fw-version. Put error message and return directly from function with error.

Why do not you just write it down?

- · Now check if device needs a firmware update. If so, set it up and leave the function without error.
- Device needs a firmware update. Finish setting up but don't do anything.
- Load profile from device if the hw-pointer is not set yet and hw-loading is possible and allowed.
   return error if mode == 2 (load always) and loading got an error. Else reset HWLOAD feature, because hwload must be 1.

That is real Horror code.

# **Data Structures**

struct \_readlines\_ctx

#### **Macros**

- #define S\_GID\_READ (gid >= 0 ? S\_CUSTOM\_R : S\_READ)
- #define MAX\_BUFFER (1024 \* 1024 1)

#### **Functions**

- int rm\_recursive (const char \*path)
- void \_updateconnected ()

\_updateconnected Update the list of connected devices.

void updateconnected ()

Update the list of connected devices.

- int \_mknotifynode (usbdevice \*kb, int notify)
- int mknotifynode (usbdevice \*kb, int notify)

Creates a notification node for the specified keyboard.

- int rmnotifynode (usbdevice \*kb, int notify)
- int rmnotifynode (usbdevice \*kb, int notify)

Removes a notification node for the specified keyboard.

- static int \_mkdevpath (usbdevice \*kb)
- int mkdevpath (usbdevice \*kb)

Create a dev path for the keyboard at index. Returns 0 on success.

int rmdevpath (usbdevice \*kb)

Remove the dev path for the keyboard at index. Returns 0 on success.

• int mkfwnode (usbdevice \*kb)

Writes a keyboard's firmware version and poll rate to its device node.

- void readlines ctx init (readlines ctx \*ctx)
- void readlines ctx free (readlines ctx ctx)
- unsigned readlines (int fd, readlines\_ctx ctx, const char \*\*input)

### **Variables**

- const char \*const devpath = "/dev/input/ckb"
- long gid = -1

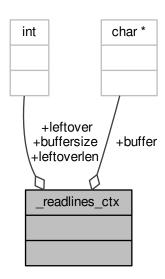

Group ID for the control nodes. -1 to give read/write access to everybody.

```

Here is the caller graph for this function:

9.12.3.4 void updateconnected ( )

<devicepath> normally is /dev/input/ckb or /input/ckb.

Open the normal file under <devicepath>0/connected for writing. For each device connected, print its devicepath+number, the serial number of the usb device and the usb name of the device connected to that usb interface.

eg

/dev/input/ckb1 0F022014ABABABABABABABABABABABA999 Corsair K95 RGB Gaming Keyboard

/dev/input/ckb2 0D02303DBACBACBACBACBACBACBACBACBAC998 Corsair M65 RGB Gaming Mouse

Set the file ownership to root. If the glob var gid is explicitly set to something different from -1 (the initial value), set file permission to 640, else to 644. This is used if you start the daemon with –gid=<GID> Parameter.

Because several independent threads may call <u>updateconnected()</u>, protect that procedure with locking/unlocking of **devmutex**.

Definition at line 55 of file devnode.c.

References ckb\_warn, DEV\_MAX, devmutex, devpath, gid, IS\_CONNECTED, keyboard, and S\_GID\_READ. Referenced by \_mkdevpath(), and updateconnected().

- #define S\_CUSTOM\_R (S\_IRUSR | S\_IWUSR | S\_IRGRP)

# **Typedefs**

• typedef struct \_readlines\_ctx \* readlines\_ctx

Custom readline is needed for FIFOs. fopen()/getline() will die if the data is sent in too fast.

#### **Functions**

· void updateconnected ()

Update the list of connected devices.

• int mkdevpath (usbdevice \*kb)

Create a dev path for the keyboard at index. Returns 0 on success.

int rmdevpath (usbdevice \*kb)

Remove the dev path for the keyboard at index. Returns 0 on success.

• int mknotifynode (usbdevice \*kb, int notify)

Creates a notification node for the specified keyboard.

int rmnotifynode (usbdevice \*kb, int notify)

Removes a notification node for the specified keyboard.

int mkfwnode (usbdevice \*kb)

Writes a keyboard's firmware version and poll rate to its device node.

- void readlines\_ctx\_init (readlines\_ctx \*ctx)
- void readlines ctx free (readlines ctx ctx)
- unsigned readlines (int fd, readlines\_ctx ctx, const char \*\*input)

#### **Variables**

· const char \*const devpath

Device path base ("/dev/input/ckb" or "/var/run/ckb")

long gid

Group ID for the control nodes. -1 to give read/write access to everybody.

#### **Macros**

#define IS\_WHEEL(scan, kb) (((scan) == KEY\_VOLUMEUP || (scan) == KEY\_VOLUMEDOWN || (scan) == BTN\_WHEELUP || (scan) == BTN\_WHEELDOWN) && !IS\_K65(kb))

# **Functions**

- int macromask (const uchar \*key1, const uchar \*key2)
- static void macro\_pt\_enqueue ()

macro\_pt\_enqueue Save the new thread in the single linked list (FIFO).

• static pthread\_t macro\_pt\_dequeue ()

macro\_pt\_dequeue gets the first thread id of the list and returns the thread\_id stored in it.

static pthread\_t macro\_pt\_first ()

macro\_pt\_first returns the first pthread\_id but does not remove the first entry.

static void \* play\_macro (void \*param)

play\_macro is the code for all threads started to play a macro.

static void inputupdate\_keys (usbdevice \*kb)

inputupdate\_keys Handle input from Keyboard or mouse; start Macrof if detected.

- void inputupdate (usbdevice \*kb)
- void updateindicators\_kb (usbdevice \*kb, int force)
- · void initbind (binding \*bind)
- void freebind (binding \*bind)
- void cmd\_bind (usbdevice \*kb, usbmode \*mode, int dummy, int keyindex, const char \*to)
- void cmd\_unbind (usbdevice \*kb, usbmode \*mode, int dummy, int keyindex, const char \*to)
- void cmd\_rebind (usbdevice \*kb, usbmode \*mode, int dummy, int keyindex, const char \*to)
- static void cmd macro (usbmode \*mode, const char \*keys, const char \*assignment)
- void cmd\_macro (usbdevice \*kb, usbmode \*mode, const int notifynumber, const char \*keys, const char \*assignment)

# **Variables**

static ptlist\_t \* pt\_head = 0

pt\_head is the head pointer for the single linked thread list managed by macro\_pt\_en/dequeue().

• static ptlist t \* pt tail = 0

pt\_tail is the tail pointer for the single linked thread list managed by macro\_pt\_en/dequeue().

#### 9.20.1 Macro Definition Documentation

```

```
9.20.2.14 static void* play_macro ( void * param ) [static]
```

#### **Parameters**

param parameter\_t to store Kb-ptr and macro-ptr (thread may get only one user-parameter)

### Returns

0 on success, -1 else (no one is interested in it except the kernel...)

First have a look if we are the first and only macro-thread to run. If not, wait. So enqueue our thread first, so it is remembered for us and can be seen by all others.

- < If the first thread in the list is not our, another one is running
- < Give all new threads the chance to enter the block.

Send events for each keypress in the macro

- < Synchonization between macro output and color information
- < use this unlock / relock for enablling the parallel running colorization
- < local delay set
- < use default global delay
- < use delays depending on macro length
- < protect the linked list and the mvar
- < Wake up all waiting threads
- < for the linked list and the mvar
- < Sync keyboard input/output and colorization

```

```
9.29.1.6 int loadrgb_kb ( usbdevice * kb, lighting * light, int mode )
```

Since Firmware Version 2.05 for K95RGB the answers for getting the stored color-maps from the hardware has changed a bit. So comparing for the correct answer cannot validate against the cmd, and has to be done against a third map. Up to now we know, that K70RGB Pro and K70 Lux RGB have firmware version 2.04 and having the problem also. So we have to determine in the most inner loop the firmware version and type of KB to select the correct compare-table.

Read colors

```
< That is the old comparison method: you get back what you sent.
```

Normally a firmware version  $\geq$ = 2.05 runs with the new compare array. Up to now there is a 2.04 running in K70 RGB Lux with the same behavior. It seems that K70RGB has the same problem

#### 9.30.2 Function Documentation

#### 9.30.2.1 int loadrgb\_kb ( usbdevice \* kb, lighting \* light, int mode )

Since Firmware Version 2.05 for K95RGB the answers for getting the stored color-maps from the hardware has changed a bit. So comparing for the correct answer cannot validate against the cmd, and has to be done against a third map. Up to now we know, that K70RGB Pro and K70 Lux RGB have firmware version 2.04 and having the problem also. So we have to determine in the most inner loop the firmware version and type of KB to select the correct compare-table.

Read colors

```
< That is the old comparison method: you get back what you sent.
```

Normally a firmware version >= 2.05 runs with the new compare array. Up to now there is a 2.04 running in K70 RGB Lux with the same behavior. It seems that K70RGB has the same problem

# 9.32.2 Variable Documentation

```
9.32.2.1 int features mask
```

features\_mask Mask of features to exclude from all devices

That bit mask ist set to enable all (-1). When interpreting the input parameters, some of these bits can be cleared.

At the moment binding, notifying and mouse-acceleration can be disabled via command line.

Have a look at main() in main.c for details.

### 9.41.1 Function Documentation

```
9.41.1.1 int resetusb ( usbdevice *kb, const char *file, int line )
```

resetusb Reset a USB device.

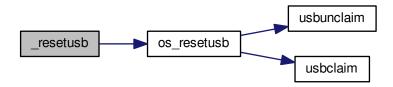

First reset the device via os\_resetusb() after a long delay (it may send something to the host). If this worked (retval == 0), give the device another long delay Then perform the initialization via the device specific start() function entry in kb->vtable and if this is successful also, return the result of the device dependen updatergb() with force=true.

Definition at line 426 of file usb.c.

References usbdevice::active, DELAY\_LONG, os\_resetusb(), and usbdevice::vtable.

```
427
        // Perform a USB reset
428
        DELAY_LONG(kb);
429
        int res = os_resetusb(kb, file, line);
430
        if(res)
431
        return res;
DELAY_LONG(kb);
432
433
        // Re-initialize the device
434
        if (kb->vtable->start(kb, kb->active) != 0)
435
             return -1;
        if (kb->vtable->updatergb(kb, 1) != 0)
436
437
            return -1;
438
        return 0:
439 }
```

Here is the call graph for this function:

```
9.41.1.2 static void*_setupusb(void* context) [static]
```

\_setupusb A horrible function for setting up an usb device

#### **Parameters**

context	As	_setupusb() is called as a new thread, the kb* is transferred as void*	
---------	----	--	--

### Returns

a ptread t\* 0, here casted as void\*. Retval is always null

The basic structure of the function is somewhat habituated. It is more like an assembler routine than a structured program. This is not really bad, but just getting used to.

After every action, which can be practically fault-prone, the routine goes into the same error handling: It goes via goto to one of two exit labels. The difference is whether or not an unlock has to be performed on the imutex variable. In both cases, closeusb() is called, then an unlock is performed on the dmutex.

The only case where this error handling is not performed is the correct return of the call to devmain(). Here simply the return value of devmain() is passed to the caller.

In either case, the routine terminates with a void\* 0 because either devmain() has returned constant null or the routine itself returns zero.

The basic idea of this routine is the following:

First some initialization of kb standard structured and local vars is done.

- · kb is set to the pointer given from start environment
- · local vars vendor and product are set to the values from the corresponding fields of kb
- local var vt and the kb->vtable are both set to the retval of get\_vtable()
- kb->features are set depending on the type of hardware connected:
  - set either to standard non rgb (all common flags like binding, notify, FW, hardware-loading etc) or in case of RGB-device set to standard + RGB, pollrate-change and fw-update
  - exclude all features which are disabled via feature mask (set by daemon CLI parameters)
  - if it is a mouse, add adjust-rate
  - if it is a monochrome device, set the flag for RGB-protocol, but single color
- the standard delay time is initialized in kb->usbdelay
- A fixed 100ms wait is the start. Although the DELAY\_LONG macro is given a parameter, it is ignored.
   Occasionally refactor it.
- The first relevant point is the operating system-specific opening of the interface in os\_setupusb(). As a result, some parameters should be set in kb (name, serial, fwversion, epcount = number of usb endpoints), and all endpoints should be claimed with usbclaim(). Claiming is the only point where os\_setupusb() can produce an error (-1, otherwise 0).
- The following two statements deal with possible errors when setting the kb values in the current routine: If the version or the name was not read correctly, they are set to default values:
  - serial is set to "<vendor>: cproduct> -NoID"
  - the name is set to "<vendor> <product>".
- Then the user level input subsystem is activated via os\_openinput(). There are two file descriptors, one for the mouse and one for the keyboard. As mentioned in structures.h, not the just opened FD numbers are stored under kb->uinput\_kb or kb->uinput\_mouse, but the values increased by 1! The reason is, if the open fails or not open has been done until now, that struct member is set to 0, not to -1 or other negative value. So all usage of this kb->handle must be something like "kb->handle 1", as you can find it in the code.
- The next action is to create a separate thread, which gets as parameter kb and starts with os\_inputmain(). The thread is immediately detached so that it can return its resource completely independently if it should terminate.

• The same happens with os\_setupindicators(), which initially initializes all LED variables in kb to off and then starts the \_ledthread() thread with kb as parameter and then detaches it. Here again only the generation of the thread can fail.

• Via an entry in the vable (allocprofile, identical for all three vtable types), allocprofile() is called in profile.c. With a valid parameter kb, a usbprofile structure is allocated and stored as a kb->profile. Then initmode() is called for each of the initializable modes (MODE\_COUNT, currently 6). This procedure creates the memory space for the mode information, initializes the range to 0, and then sets the light.forceupdate and dpi.forceupdate to true. This forces an update later in the initialization of the device.

The first mode is set as the current mode and two force flags are set (this seems to be mode-intersecting flags for light and update).

### Warning

There is no error handling for the allocprofile() and initmode() procedures. However, since they allocate storage areas, the subsequent assignments and initializations can run in a SEGV.

• Not completely understandable is why now via the vtable the function updateindicators() is called. But this actually happens in the just started thread <u>ledthread()</u>. Either the initialization is wrong und must done here with force or the overview is lost, what happens when...

Regardless: For a mouse nothing happens here, for a keyboard updateindicators\_kb() is called via the entry in kb->vtable. The first parameter is kb again, the second is constant 1 (means force = true). This causes the LED status to be sent after a 5ms delay via os\_sendindicators() (ioctl with a usbdevfs\_ctrltransfer).

The notification is sent to all currently open notification channels then.

Setupindicators() and with it updateindicators\_kb() can fail.

- From this point if an error is detected the error label is addressed by goto statement, which first performs an unlock on the imutex. This is interesting because the next statement is exactly this: An unlock on the imutex.
- Via vtable the *kb->start()* function is called next. This is the same for a mouse and an RGB keyboard: start\_dev(), for a non RGB keyboard it is start\_kb\_nrgb().

First parameter is as always kb, second is 0 (makeactive = false).

 In start\_kb\_nrgb() set the keyboard into a so-called software mode (NK95\_HWOFF) via ioctl with usbdevfs\_ctrltransfer in function \_nk95cmd(), which will in turn is called via macro nk95cmd() via start\_kb\_nrgb().

Then two dummy values (active and pollrate) are set in the kb structure and ready.

- start\_dev() does a bit more because this function is for both mouse and keyboard. start\_dev() calls after setting an extended timeout parameter start dev(). Both are located in device.c.
- First, \_start\_dev() attempts to determine the firmware version of the device, but only if two conditions
  are met: hwload-mode is not null (then hw-loading is disabled) and the device has the FEAT\_HWLOAD
  feature. Then the firmware and the poll rate are fetched via getfwersion().
  - If hwload\_mode is set to "load only once" (==1), then the HWLOAD feature is masked, so that no further reading can take place.
- Now check if device needs a firmware update. If so, set it up and leave the function without error.
- Else load the hardware profile from device if the hw-pointer is not set and hw-loading is possible and allowed.
  - Return error if mode == 2 (load always) and loading got an error. Else mask the HWLOAD feature, because hwload must be 1 and the error could be a repeated hw-reading.

Puh, that is real Horror code. It seems to be not faulty, but completely unreadable.

Finally, the second parameter of \_startdev() is used to check whether the device is to be activated.
 Depending on the parameter, the active or the idle-member in the correspondig vtable is called. These are device-dependent again:

Device	active	idle
RGB Keyboard	cmd_active_kb() means: start	cmd_idle_kb() set the device
	the device with a lot of	with a lot of kb-specific
	kb-specific initializers (software	initializers into the hardware
	controlled mode)	controlled mode)
non RGB Keyboard	cmd_io_none() means: Do	cmd_io_none() means: Do
	nothing	nothing
Mouse	cmd_active_mouse() similar to	cmd_idle_mouse similar to
	cmd_active_kb()	cmd_idle_kb()

- If either start() succeeded or the next following usb\_tryreset(), it goes on, otherwise again a hard abort occurs.
- Next, go to mkdevpath(). After securing the EUID (effective UID) especially for macOS, work starts really in \_mkdevpath(). Create no matter how many devices were registered either the ckb0/ files version, pid and connected or the cmd command fifo, the first notification fifo notify0, model and serial as well as the features of the device and the pollrate.
- If all this is done and no error has occurred, a debug info is printed ("Setup finished for ckbx") updateconnected() writes the new device into the text file under ckb0/ and devmain() is called.

devmain()'s return value is returned by \_setupusb() when we terminate.

· The remaining code lines are the two exit labels as described above

Here is the call graph for this function:

Here is the caller graph for this function:

9.41.1.3 int\_usbrecv ( usbdevice \* kb, const uchar \* out\_msg, uchar \* in\_msg, const char \* file, int line )

\_usbrecv Request data from a USB device by first sending an output packet and then reading the response.

To fully understand this, you need to know about usb: All control is at the usb host (the CPU). If the device wants to communicate something to the host, it must wait for the host to ask. The usb protocol defines the cycles and periods in which actions are to be taken.

So in order to receive a data packet from the device, the host must first send a send request.

This is done by \_usbrecv() in the first block by sending the MSG\_SIZE large data block from **out\_msg** via os\_usbsend() as it is a machine depending implementation. The usb target device is as always determined over kb.

For os\_usbsend() to know that it is a receive request, the **is\_recv** parameter is set to true (1). With this, os\_usbsend () generates a control package for the hardware, not a data packet.

If sending of the control package is not successful, a maximum of 5 times the transmission is repeated (including the first attempt). If a non-cancelable error is signaled or the drive is stopped via reset\_stop, \_usbrecv() immediately returns 0.

After this, the function waits for the requested response from the device using os usbrecv ().

os\_usbrecv() returns 0, -1 or something else.

Zero signals a serious error which is not treatable and <u>usbrecv()</u> also returns 0.

-1 means that it is a treatable error - a timeout for example - and therefore the next transfer attempt is started after a long pause (DELAY\_LONG) if not reset\_stop or the wrong hwload\_mode require a termination with a return value of 0.

After 5 attempts, usbrecv () returns and returns 0 as well as an error message.

When data is received, the number of received bytes is returned. This should always be MSG\_SIZE, but os\_usbrecv() can also return less. It should not be more, because then there would be an unhandled buffer overflow, but it could be less. This would be signaled in os\_usbrecv () with a message.

The buffers behind **out\_msg** and **in\_msg** are MSG\_SIZE at least (currently 64 Bytes). More is ok but useless, less brings unpredictable behavior. < Synchonization between macro and color information

Here is the call graph for this function:

9.41.1.4 int usbsend ( usbdevice \* kb, const uchar \* messages, int count, const char \* file, int line )

\_usbsend send a logical message completely to the given device

Todo A lot of different conditions are combined in this code. Don't think, it is good in every combination...

The main task of \_usbsend () is to transfer the complete logical message from the buffer beginning with *messages* to **count** \* **MSG\_SIZE**.

According to usb 2.0 specification, a USB transmits a maximum of 64 byte user data packets. For the transmission of longer messages we need a segmentation. And that is exactly what happens here.

The message is given one by one to os\_usbsend() in MSG\_SIZE (= 64) byte large bites.

### Attention

This means that the buffer given as argument must be  $n * MSG\_SIZE$  Byte long.

An essential constant parameter which is relevant for os\_usbsend() only is is\_recv = 0, which means sending. Now it gets a little complicated again:

- If os\_usbsend() returns 0, only zero bytes could be sent in one of the packets, or it was an error (-1 from the systemcall), but not a timeout. How many Bytes were sent in total from earlier calls does not seem to matter, \_usbsend() returns a total of 0.
- Returns os\_usbsend() -1, first check if reset\_stop is set globally or (incomprehensible) hwload\_mode is not
  set to "always". In either case, \_usbsend() returns 0, otherwise it is assumed to be a temporary transfer error
  and it simply retransmits the physical packet after a long delay.
- If the return value of os\_usbsend() was neither 0 nor -1, it specifies the numer of bytes transferred.

  Here is an information hiding conflict with os\_usbsend() (at least in the Linux version):

If os\_usbsend() can not transfer the entire packet, errors are thrown and the number of bytes sent is returned. \_usbsend() interprets this as well and remembers the total number of bytes transferred in the local variable total\_sent. Subsequently, however, transmission is continued with the next complete MSG\_SIZE block and not with the first of the possibly missing bytes.

**Todo** Check whether this is the same in the macOS variant. It is not dramatic, but if errors occur, it can certainly irritate the devices completely if they receive incomplete data streams. Do we have errors with the messages "Wrote YY bytes (expected 64)" in the system logs? If not, we do not need to look any further.

When the last packet is transferred, <u>\_usbsend()</u> returns the effectively counted set of bytes (from **total\_sent**). This at least gives the caller the opportunity to check whether something has been lost in the middle.

A bit strange is the structure of the program: Handling the **count** MSG\_SIZE blocks to be transferred is done in the outer for (...) loop. Repeating the transfer with a treatable error is managed by the inner while(1) loop.

This must be considered when reading the code; The "break" on successful block transfer leaves the inner while, not the for (...). < Synchonization between macro and color information

555 }
```

Here is the call graph for this function:

### 9.41.1.5 int closeusb ( usbdevice \* kb )

closeusb Close a USB device and remove device entry.

An imutex lock ensures first of all, that no communication is currently running from the viewpoint of the driver to the user input device (ie the virtual driver with which characters or mouse movements are sent from the daemon to the operating system as inputs).

If the **kb** has an acceptable value != 0, the index of the device is looked for and with this index os\_inputclose() is called. After this no more characters can be sent to the operating system.

Then the connection to the usb device is capped by os\_closeusb().

**Todo** What is not yet comprehensible is the call to updateconnected() BEFORE os\_closeusb(). Should that be in the other sequence? Or is updateconnected() not displaying the connected usb devices, but the representation which uinput devices are loaded? Questions about questions ...

If there is no valid **handle**, only updateconnected() is called. We are probably trying to disconnect a connection under construction. Not clear.

The cmd pipe as well as all open notify pipes are deleted via rmdevpath ().

This means that nothing can happen to the input path - so the device-specific imutex is unlocked again and remains unlocked.

Also the dmutex is unlocked now, but only to join the thread, which was originally taken under **kb->thread** (which started with \_setupusb()) with pthread\_join() again. Because of the closed devices that thread would have to quit sometime

See Also

the hack note with rmdevpath())

As soon as the thread is caught, the dmutex is locked again, which is what I do not understand yet: What other thread can do usb communication now?

If the vtabel exists for the given kb (why not? It seems to have race conditions here!!), via the vtable the actually device-specific, but still everywhere identical freeprofile() is called. This frees areas that are no longer needed. Then the **usbdevice** structure in its array is set to zero completely.

Error handling is rather unusual in closeusb(); Everything works (no matter what the called functions return), and closeusb() always returns zero (success).

Here is the call graph for this function:

Here is the caller graph for this function:

**9.41.1.6** static void\* devmain ( usbdevice \* kb ) [static]

devmain is called by \_setupusb

## Parameters

kb	the pointer to the device. Even if it has the name kb, it is valid also for a mouse (the whole
	driver seems to be implemented first for a keyboard).

### Returns

always a nullptr

## **Synchronization**

The syncing via mutexes is interesting:

# 1. imutex (the Input mutex)

This one is locked in <code>setupusb()</code>. That function does only two things: Locking the mutex and trying to start a thread at <code>\_setupusb()</code>. <code>\_setupusb()</code> unlocks <code>imutex</code> after getting some buffers and initalizing internal structures from the indicators (this function often gets problems with error messages like "unable to read indicators" or "Timeout bla blubb").

Warning

have a look at updateindicators() later.

if creating the thread is not successful, the imutex remains blocked. Have a look at setupusb() later.

### 2. dmutex (the Device mutex)

This one is very interesting, because it is handled in devmain(). It seems that it is locked only in \_ledthread(), which is a thread created in os\_setupindicators(). os\_setupindicators() again is called in \_setupusb() long before calling devmain(). So this mutex is locked when we start the function as the old comment says.

Before reading from the FIFO and direct afterwards an unlock..lock sequence is implemented here. Even if only the function readlines() should be surrounded by the unlock..lock, the variable definition of the line pointer is also included here. Not nice, but does not bother either. Probably the Unlock..lock is needed so that now another process can change the control structure *linectx* while we wait in readlines().

**Todo** Hope to find the need for dmutex usage later.

Should this function be declared as pthread\_t\* function, because of the defintion of pthread-create? But void\* works also...

#### Attention

dmutex should still be locked when this is called

First a readlines ctx buffer structure is initialized by readlines\_ctx\_init().

After some setup functions, beginning in \_setupusb() which has called devmain(), we read the command input-Fifo designated to that device in an endless loop. This loop has two possible exits (plus reaction to signals, not mentioned here).

If the reading via readlines() is successful (we might have read multiple lines), the interpretation is done by readcmd() iff the connection to the device is still available (checked via IS\_CONNECTED(kb)). This is true if the kb-structure has a handle and an event pointer both != Null). If not, the loop is left (the first exit point).

if nothing is in the line buffer (some magic interrupt?), continue in the endless while without any reaction.

**Todo** readcmd() gets a **line**, not **lines**. Have a look on that later.

Is the condition IS\_CONNECTED valid? What functions change the condititon for the macro?

If interpretation and communication with the usb device got errors, they are signalled by readcmd() (non zero retcode). In this case the usb device is closed via closeusb() and the endless loop is left (the second exit point).

After leaving the endless loop the readlines-ctx structure and its buffers are freed by readlines ctx free().

Here is the caller graph for this function:

9.41.1.7 static const devcmd\* get\_vtable ( short vendor, short product ) [static]

get\_vtable returns the correct vtable pointer

### **Parameters**

vendor	short usb vendor ID
product	short usb product ID

## Returns

Depending on the type and model, the corresponding vtable pointer is returned (see below)

At present, we have three different vtables:

- vtable\_mouse is used for all mouse types. This may be wrong with some newer mice?
- vtable\_keyboard is used for all RGB Keyboards.
- $\bullet$  vtable\_keyboard\_nonrgb for all the rest.

Todo Is the last point really a good decision and always correct?

Definition at line 102 of file usb.c.

References IS\_MOUSE, IS\_RGB, vtable\_keyboard, vtable\_keyboard\_nonrgb, and vtable\_mouse.

Referenced by \_setupusb().

Here is the caller graph for this function:

9.41.1.8 const char\* product\_str ( short product )

product\_str returns a condensed view on what type of device we have.

At present, various models and their properties are known from corsair products. Some models differ in principle (mice and keyboards), others differ in the way they function (for example, RGB and non RGB), but they are very similar.

Here, only the first point is taken into consideration and we return a unified model string. If the model is not known with its number, *product\_str* returns an empty string.

The model numbers and corresponding strings wwith the numbers in hex-string are defined in usb.h

At present, this function is used to initialize kb->name and to give information in debug strings.

Attention

The combinations below have to fit to the combinations in the macros mentioned above. So if you add a device with a new number, change both.

**Todo** There are macros defined in usb.h to detect all the combinations below. the only difference is the parameter: The macros need the *kb\**, product str() needs the *product ID*

### 9.41.1.9 int revertusb ( usbdevice \* kb )

revertusb sets a given device to inactive (hardware controlled) mode if not a fw-ugrade is indicated First is checked, whether a firmware-upgrade is indicated for the device. If so, revertusb() returns 0.

**Todo** Why is this useful? Are there problems seen with deactivating a device with older fw-version??? Why isn't this an error indicating reason and we return success (0)?

Anyway, the following steps are similar to some other procs, dealing with low level usb handling:

• If we do not have an RGB device, a simple setting to Hardware-mode (NK95\_HWON) is sent to the device via n95cmd().

**Todo** The return value of nk95cmd() is ignored (but sending the ioctl may produce an error and \_nk95\_cmd will indicate this), instead revertusb() returns success in any case.

• If we have an RGB device, setactive() is called with second param active = false. That function will have a look on differences between keyboards and mice.

More precisely setactive() is just a macro to call via the kb->vtable enties either the active() or the idle() function where the vtable points to. setactive() may return error indications. If so, revertusb() returns -1, otherwise 0 in any other case.

Referenced by usbadd().

Here is the call graph for this function:

Here is the caller graph for this function:

```
9.41.1.11 int usb_tryreset ( usbdevice * kb )
```

usb\_tryreset does what the name means: Try to reset the usb via resetusb()

This function is called if an usb command ran into an error in case of one of the following two situations:

When setting up a new usb device and the start() function got an error (
 See Also

```
_setupusb())
```

· If upgrading to a new firmware gets an error (

See Also

```
cmd_fwupdate()).
```

The previous action which got the error will NOT be re-attempted.

In an endless loop usb tryreset() tries to reset the given usb device via the macro resetusb().

This macro calls <u>resetusb()</u> with debugging information.

\_resetusb() sends a command via the operating system dependent function os\_resetusb() and - if successful - reinitializes the device. os\_resetusb() returns -2 to indicate a broken device and all structures should be removed for it.

In that case, the loop is terminated, an error message is produced and usb\_tryreset() returns -1.

In case resetusb() has success, the endless loop is left via a return 0 (success).

If the return value from resetusb() is -1, the loop is continued with the next try.

If the global variable **reset\_stop** is set directly when the function is called or after each try, **usb\_tryreset()** stops working and returns -1.

Todo Why does usb tryreset() hide the information returned from resetusb()? Isn't it needed by the callers?

# **Macros**

• #define V\_CORSAIR 0x1b1c

For the following Defines please see "Detailed Description".

- #define V\_CORSAIR\_STR "1b1c"
- #define P\_K65 0x1b17
- #define P\_K65\_STR "1b17"
- #define P\_K65\_NRGB 0x1b07
- #define P\_K65\_NRGB\_STR "1b07"
- #define P K65 LUX 0x1b37
- #define P\_K65\_LUX\_STR "1b37"

- #define P\_K65\_RFIRE 0x1b39
- #define P K65 RFIRE STR "1b39"
- #define IS\_K65(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K65 || (kb)->product == P\_K65\_LUX || (kb)->product == P\_K65\_RFIRE))
- #define P\_K70 0x1b13
- #define P\_K70\_STR "1b13"
- #define P K70 NRGB 0x1b09
- #define P\_K70\_NRGB\_STR "1b09"
- #define P\_K70\_LUX 0x1b33
- #define P K70 LUX STR "1b33"
- #define P\_K70\_LUX\_NRGB 0x1b36
- #define P K70 LUX NRGB STR "1b36"
- #define P K70 RFIRE 0x1b38
- #define P\_K70\_RFIRE\_STR "1b38"
- #define P\_K70\_RFIRE\_NRGB 0x1b3a
- #define P K70 RFIRE NRGB STR "1b3a"
- #define IS\_K70(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K70 || (kb)->product == P\_K70\_NRGB || (kb)->product == P\_K70\_RFIRE || (kb)->product == P\_K70\_LUX || (kb)->product == P\_K70\_LUX\_NRGB))
- #define P\_K95 0x1b11
- #define P\_K95\_STR "1b11"
- #define P K95 NRGB 0x1b08
- #define P K95 NRGB STR "1b08"
- #define P K95 PLATINUM 0x1b2d
- #define P K95 PLATINUM STR "1b2d"
- #define IS\_K95(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K95 || (kb)->product == P\_K95-NRGB || (kb)->product == P\_K95\_PLATINUM))
- #define P STRAFE 0x1b20
- #define P STRAFE STR "1b20"
- #define P STRAFE NRGB 0x1b15
- #define P\_STRAFE\_NRGB\_STR "1b15"
- #define IS\_STRAFE(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_STRAFE || (kb)->product == P\_STRAFE\_NRGB))
- #define P\_M65 0x1b12
- #define P\_M65\_STR "1b12"
- #define P M65 PRO 0x1b2e
- #define P\_M65\_PRO\_STR "1b2e"
- #define IS\_M65(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_M65 || (kb)->product == P\_M65 || (kb)->p
- #define P SABRE O 0x1b14 /\* optical \*/
- #define P SABRE O STR "1b14"
- #define P\_SABRE\_L 0x1b19 /\* laser \*/
- #define P\_SABRE\_L\_STR "1b19"
- #define P\_SABRE\_N 0x1b2f /\* new? \*/
- #define P\_SABRE\_N\_STR "1b2f"
- #define P\_SABRE\_O2 0x1b32 /\* Observed on a CH-9000111-EU model SABRE \*/
- #define P\_SABRE\_O2\_STR "1b32"
- #define IS\_SABRE(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_SABRE\_O || (kb)->product == P\_SABRE\_L || (kb)->product == P\_SABRE\_N || (kb)->product == P\_SABRE\_O2))
- #define P SCIMITAR 0x1b1e
- #define P SCIMITAR STR "1b1e"
- #define P SCIMITAR PRO 0x1b3e
- #define P SCIMITAR PRO STR "1b3e"
- #define IS\_SCIMITAR(kb) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_SCIMITAR || (kb)->product == P\_SCIMITAR\_PRO))

#define IS\_RGB(vendor, product) ((vendor) == (V\_CORSAIR) && (product) != (P\_K65\_NRGB) && (product) != (P K70 NRGB) && (product) != (P K95 NRGB))

RGB vs non-RGB test (note: non-RGB Strafe is still considered "RGB" in that it shares the same protocol. The difference is denoted with the "monochrome" feature).

#define IS\_MONOCHROME(vendor, product) ((vendor) == (V\_CORSAIR) && (product) == (P\_STRAFE\_N-RGB))

The difference between non RGB and monochrome is, that monochrome has lights, but just in one color. nonRGB has no lights. Change this if new **monochrome** devices are added.

#define IS\_RGB\_DEV(kb) IS\_RGB((kb)->vendor, (kb)->product)

For calling with a usbdevice\*, vendor and product are extracted and IS\_RGB() is returned.

#define IS\_MONOCHROME\_DEV(kb) IS\_MONOCHROME((kb)->vendor, (kb)->product)

For calling with a usbdevice\*, vendor and product are extracted and IS\_MONOCHROME() is returned.

#define IS\_FULLRANGE(kb) (IS\_RGB((kb)->vendor, (kb)->product) && (kb)->product != P\_K65 && (kb)->product != P\_K70 && (kb)->product != P\_K95)

Full color range (16.8M) vs partial color range (512)

#define IS\_MOUSE(vendor, product) ((vendor) == (V\_CORSAIR) && ((product) == (P\_M65) || (product) == (P\_M65\_PRO) || (product) == (P\_SABRE\_O) || (product) == (P\_SABRE\_L) || (product) == (P\_SCIMITAR) || (product) == (P\_SCIMITAR\_PRO) || (product) == (P\_SABRE\_O2)))

Mouse vs keyboard test.

• #define IS MOUSE DEV(kb) IS MOUSE((kb)->vendor, (kb)->product)

For calling with a usbdevice\*, vendor and product are extracted and IS\_MOUSE() is returned.

#define DELAY SHORT(kb) usleep((int)(kb)->usbdelay \* 1000)

USB delays for when the keyboards get picky about timing That was the original comment, but it is used anytime. The short delay is used before any send or receive.

• #define DELAY MEDIUM(kb) usleep((int)(kb)->usbdelay \* 10000)

the medium delay is used after sending a command before waiting for the answer.

#define DELAY\_LONG(kb) usleep(100000)

The longest delay takes place where something went wrong (eg when resetting the device)

• #define USB DELAY DEFAULT 5

This constant is used to initialize **kb->usbdelay**. It is used in many places (see macros above) but often also overwritten to the fixed value of 10. Pure Hacker code.

• #define resetusb(kb) \_resetusb(kb, \_\_FILE\_NOPATH\_\_, \_\_LINE\_\_)

resetusb() is just a macro to call \_resetusb() with debuggin constants (file, lineno)

- #define usbsend(kb, messages, count) \_usbsend(kb, messages, count, \_\_FILE\_NOPATH\_\_, \_\_LINE\_\_)
   usbsend macro is used to wrap \_usbsend() with debugging information (file and lineno)
- #define usbrecv(kb, out\_msg, in\_msg) \_usbrecv(kb, out\_msg, in\_msg, \_\_FILE\_NOPATH\_\_, \_\_LINE\_\_)
   usbrecv macro is used to wrap\_usbrecv() with debugging information (file and lineno)
- #define nk95cmd(kb, command) \_nk95cmd(kb, (command) >> 16 & 0xFF, (command) & 0xFFFF, \_\_FILE\_-NOPATH\_\_, \_\_LINE\_\_)

nk95cmd() macro is used to wrap \_nk95cmd() with debugging information (file and lineno). the command structure is different:

Just the bits 23..16 are used as bits 7..0 for bRequest

Bits 15..0 are used as wValue

#define NK95 HWOFF 0x020030

Hardware-specific commands for the K95 nonRGB,.

#define NK95\_HWON 0x020001

Hardware playback on.

#define NK95 M1 0x140001

Switch to mode 1.

• #define NK95\_M2 0x140002

Switch to mode 2.

#define NK95\_M3 0x140003

Switch to mode 3.

# **Functions**

const char \* vendor str (short vendor)

uncomment the following Define to see USB packets sent to the device

const char \* product\_str (short product)

product\_str returns a condensed view on what type of device we have.

• int usbmain ()

Start the USB main loop. Returns program exit code when finished.

· void usbkill ()

Stop the USB system.

void setupusb (usbdevice \*kb)

setupusb starts a thread with kb as parameter and \_setupusb() as entrypoint.

int os\_setupusb (usbdevice \*kb)

os\_setupusb OS-specific setup for a specific usb device.

void \* os\_inputmain (void \*context)

os\_inputmain is run in a separate thread and will be detached from the main thread, so it needs to clean up its own resources.

int revertusb (usbdevice \*kb)

revertusb sets a given device to inactive (hardware controlled) mode if not a fw-ugrade is indicated

int closeusb (usbdevice \*kb)

closeusb Close a USB device and remove device entry.

void os closeusb (usbdevice \*kb)

os\_closeusb unclaim it, destroy the udev device and clear data structures at kb

• int \_resetusb (usbdevice \*kb, const char \*file, int line)

resetusb Reset a USB device.

int os\_resetusb (usbdevice \*kb, const char \*file, int line)

os\_resetusb is the os specific implementation for resetting usb

• int \_usbsend (usbdevice \*kb, const uchar \*messages, int count, const char \*file, int line)

\_usbsend send a logical message completely to the given device

• int \_usbrecv (usbdevice \*kb, const uchar \*out\_msg, uchar \*in\_msg, const char \*file, int line)

\_usbrecv Request data from a USB device by first sending an output packet and then reading the response.

• int os\_usbsend (usbdevice \*kb, const uchar \*out\_msg, int is\_recv, const char \*file, int line)

os\_usbsend sends a data packet (MSG\_SIZE = 64) Bytes long

• int os\_usbrecv (usbdevice \*kb, uchar \*in\_msg, const char \*file, int line)

os\_usbrecv receives a max MSGSIZE long buffer from usb device

void os\_sendindicators (usbdevice \*kb)

os\_sendindicators update the indicators for the special keys (Numlock, Capslock and what else?)

• int \_nk95cmd (usbdevice \*kb, uchar bRequest, ushort wValue, const char \*file, int line)

\_nk95cmd If we control a non RGB keyboard, set the keyboard via ioctl with usbdevfs\_ctrltransfer

• int usb\_tryreset (usbdevice \*kb)

usb tryreset does what the name means: Try to reset the usb via resetusb()

# 9.42.1 Detailed Description

# Vendor/product codes

The list of defines in the first part of the file describes the various types of equipment from Corsair and summarizes them according to specific characteristics.

Each device type is described with two defines:

- On the one hand the device ID with which the device can be recognized on the USB as a short
- and on the other hand the same representation as a string, but without leading "0x".

First entry-pair is the Provider ID (vendorID) from Corsair.

Block No.	contains	Devices are bundled via
1	The first block contains the	In summary, they can be queried
	K65-like keyboards, regardless of	using the macro IS_K65().
	their properties (RGB,).	
2	the K70-like Keyboards with all	summarized by IS_K70().
	their configuration types	
3	the K95 series keyboards	collected with the macro IS_K95().
4	strafe keyboards	IS_STRAFE()
5	M65 mice with and without RGB	IS_M65()
6	The SABRE and HARPOON mice.	IS_SABRE()
	Maybe this will be divided int two	
	different blocks later because of	
	different nummber of special keys	
7	The Scimitar mouse devices	IS_SCIMITAR()

Definition in file usb.h.

# 9.42.2 Macro Definition Documentation

9.42.2.1 #define DELAY\_LONG( kb ) usleep(100000)

Definition at line 153 of file usb.h.

Referenced by \_resetusb(), \_usbrecv(), \_usbsend(), cmd\_hwload\_kb(), cmd\_hwload\_mouse(), cmd\_hwsave\_kb(), and cmd\_hwsave\_mouse().

9.42.2.2 #define DELAY\_MEDIUM( kb ) usleep((int)(kb)->usbdelay \* 10000)

Definition at line 150 of file usb.h.

Referenced by \_usbrecv(), and setactive\_kb().

9.42.2.3 #define DELAY\_SHORT( kb ) usleep((int)(kb)->usbdelay \* 1000)

Definition at line 147 of file usb.h.

Referenced by \_usbrecv(), \_usbsend(), and updateindicators\_kb().

9.42.2.4 #define IS\_FULLRANGE( kb ) (IS\_RGB((kb)->vendor, (kb)->product) && (kb)->product != P\_K65 && (kb)->product != P\_K70 && (kb)->product != P\_K95)

Definition at line 136 of file usb.h.

Referenced by readcmd(), and updatergb\_kb().

9.42.2.5 #define IS\_K65( kb ) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K65 || (kb)->product == P\_K65\_NRGB || (kb)->product == P\_K65\_LUX || (kb)->product == P\_K65\_RFIRE))

Definition at line 49 of file usb.h.

Referenced by has\_key().

9.42.2.6 #define IS\_K70( kb ) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K70 || (kb)->product == P\_K70\_NRGB || (kb)->product == P\_K70\_RFIRE || (kb)->product == P\_K70\_RFIRE\_NRGB || (kb)->product == P\_K70\_LUX || (kb)->product == P\_K70\_LUX\_NRGB))

Definition at line 63 of file usb.h.

9.42.2.7 #define IS\_K95( kb ) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_K95 || (kb)->product == P\_K95\_NRGB || (kb)->product == P\_K95\_PLATINUM))

Definition at line 71 of file usb.h.

Referenced by cmd\_hwload\_kb(), cmd\_hwsave\_kb(), and has\_key().

9.42.2.8 #define IS\_M65( kb ) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_M65  $\mid\mid$  (kb)->product == P\_M65\_PRO))

Definition at line 83 of file usb.h.

Referenced by isblack().

9.42.2.9 #define IS\_MONOCHROME( vendor, product ) ((vendor) == (V\_CORSAIR) && (product) == (P\_STRAFE\_NRGB))

Definition at line 127 of file usb.h.

Referenced by \_setupusb().

9.42.2.10 #define IS\_MONOCHROME\_DEV( kb ) IS MONOCHROME((kb)->vendor, (kb)->product)

Definition at line 133 of file usb.h.

9.42.2.11 #define IS\_MOUSE( vendor, product) ((vendor) == (V\_CORSAIR) && ((product) == (P\_M65) || (product) == (P\_M65\_PRO) || (product) == (P\_SABRE\_O) || (product) == (P\_SABRE\_L) || (product) == (P\_SABRE\_N) || (product) == (P\_SCIMITAR) || (product) == (P\_SCIMITAR\_PRO) || (product) == (P\_SABRE\_O2)))

Definition at line 139 of file usb.h.

Referenced by \_setupusb(), get\_vtable(), has\_key(), and os\_inputmain().

9.42.2.12 #define IS\_MOUSE\_DEV( kb ) IS\_MOUSE((kb)->vendor, (kb)->product)

Definition at line 142 of file usb.h.

Referenced by readcmd().

9.42.2.13 #define IS\_RGB( vendor, product ) ((vendor) == (V\_CORSAIR) && (product) != (P\_K65\_NRGB) && (product) != (P\_K70\_NRGB) && (product) != (P\_K95\_NRGB))

Definition at line 122 of file usb.h.

Referenced by \_setupusb(), get\_vtable(), and os\_inputmain().

9.42.2.14 #define IS\_RGB\_DEV( kb ) IS\_RGB((kb)->vendor, (kb)->product)

Definition at line 130 of file usb.h.

9.42.2.15 #define IS\_SABRE( kb ) ((kb)->vendor == V\_CORSAIR && ((kb)->product == P\_SABRE\_O || (kb)->product == P\_SABRE\_O2))

Definition at line 93 of file usb.h.

Referenced by has\_key(), loadrgb\_mouse(), and savergb\_mouse().

```
9.42.2.16 #define IS_SCIMITAR( kb ) ((kb)->vendor == V_CORSAIR && ((kb)->product == P_SCIMITAR || (kb)->product == P_SCIMITAR_PRO))

Definition at line 99 of file usb.h.

Referenced by has_key(), loadrgb_mouse(), and savergb_mouse().

9.42.2.17 #define IS_STRAFE( kb ) ((kb)->vendor == V_CORSAIR && ((kb)->product == P_STRAFE || (kb)->product ==
```

Definition at line 77 of file usb.h.

Referenced by savergb\_kb().

9.42.2.18 #define NK95\_HWOFF 0x020030

P STRAFE NRGB))

### 9.42.3 Function Documentation

9.42.3.1 int \_nk95cmd ( usbdevice \* kb, uchar bRequest, ushort wValue, const char \* file, int line )

# **Parameters**

kb	THE usbdevice*
bRequest	the byte array with the usb request
wValue	a usb wValue
file	for error message
line	for error message

### Returns

1 (true) on failure, 0 (false) on success.

To send control packets to a non RGB non color K95 Keyboard, use this function. Normally it is called via the nk95cmd() macro.

If it is the wrong device for which the function is called, 0 is returned and nothing done. Otherwise a usbdevfs\_ctrltransfer structure is filled and an USBDEVFS\_CONTROL ioctl() called.

bRequest-	bRequest	wValue	EP	size	Timeout	data
Туре						
0x40	see table below to switch hardware- modus at	wValue	device	MSG_SIZE	5ms	the message buffer pointer
	Keyboard					

Host to	bRequest	given wValue	device 0	0 data to	5000	null
Device,	parameter	Parameter		write		
Type=Vendor,						
Recipi-						
ent=Device						

If a 0 or a negative error number is returned by the ioctl, an error message is shown depending on the error or "No data written" if retval was 0. In either case 1 is returned to indicate the error. If the ioctl returned a value > 0, 0 is returned to indicate no error.

Currently the following combinations for bRequest and wValue are used:

Device	what it might to	constant	bRequest	wValue
	do			
non RGB Keyboard	set HW-modus on	HWON	0x0002	0x0030
	(leave the ckb			
	driver)			
non RGB Keyboard	set HW-modus off	HWOFF	0x0002	0x0001
	(initialize the ckb			
	driver)			
non RGB Keyboard	set light modus M1	NK95_M1	0x0014	0x0001
	in single-color			
	keyboards			
non RGB Keyboard	set light modus M2	NK95_M2	0x0014	0x0002
	in single-color			
	keyboards			
non RGB Keyboard	set light modus M3	NK95_M3	0x0014	0x0003
	in single-color			
	keyboards

# 9.42.3.2 int\_resetusb ( usbdevice \* kb, const char \* file, int line )

### **Parameters**

kb	THE usbdevice*
file	filename for error messages
line	line where it is called for error messages

### Returns

Returns 0 on success, -1 if device should be removed

\_resetusb Reset a USB device.

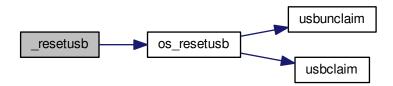

First reset the device via os\_resetusb() after a long delay (it may send something to the host). If this worked (retval == 0), give the device another long delay Then perform the initialization via the device specific start() function entry in kb->vtable and if this is successful also, return the result of the device dependen updatergb() with force=true.

Here is the call graph for this function:

9.42.3.3 int\_usbrecv ( usbdevice \* kb, const uchar \* out\_msg, uchar \* in\_msg, const char \* file, int line )

# **Parameters**

kb	THE usbdevice*
IN]	out_msg What information does the caller want from the device?
OUT]	in_msg Here comes the answer; The names represent the usb view, not the view of this
	function! So INput from usb is OUTput of this function.
IN]	file for debugging
IN]	line for debugging
IN]	reset_stop global variable is read

### Returns

number of bytes read or zero on failure.

\_usbrecv Request data from a USB device by first sending an output packet and then reading the response.

To fully understand this, you need to know about usb: All control is at the usb host (the CPU). If the device wants to communicate something to the host, it must wait for the host to ask. The usb protocol defines the cycles and periods in which actions are to be taken.

So in order to receive a data packet from the device, the host must first send a send request.

This is done by <u>\_usbrecv()</u> in the first block by sending the MSG\_SIZE large data block from **out\_msg** via os\_usbsend() as it is a machine depending implementation. The usb target device is as always determined over kb.

For os\_usbsend() to know that it is a receive request, the **is\_recv** parameter is set to true (1). With this, os\_usbsend () generates a control package for the hardware, not a data packet.

If sending of the control package is not successful, a maximum of 5 times the transmission is repeated (including the first attempt). If a non-cancelable error is signaled or the drive is stopped via reset\_stop, \_usbrecv() immediately returns 0.

After this, the function waits for the requested response from the device using os\_usbrecv ().

os\_usbrecv() returns 0, -1 or something else.

Zero signals a serious error which is not treatable and \_usbrecv() also returns 0.

-1 means that it is a treatable error - a timeout for example - and therefore the next transfer attempt is started after a long pause (DELAY\_LONG) if not reset\_stop or the wrong hwload\_mode require a termination with a return value of 0

After 5 attempts, \_usbrecv () returns and returns 0 as well as an error message.

When data is received, the number of received bytes is returned. This should always be MSG\_SIZE, but os\_usbrecv() can also return less. It should not be more, because then there would be an unhandled buffer overflow, but it could be less. This would be signaled in os\_usbrecv () with a message.

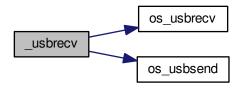

The buffers behind **out\_msg** and **in\_msg** are MSG\_SIZE at least (currently 64 Bytes). More is ok but useless, less brings unpredictable behavior. < Synchonization between macro and color information

```

Here is the call graph for this function:

9.42.3.4 int \_usbsend ( usbdevice \* kb, const uchar \* messages, int count, const char \* file, int line )

#### **Parameters**

	kb	THE usbdevice*
	IN]	messages a Pointer to the first byte of the logical message
	IN]	count how many MSG_SIZE buffers is the logical message long?
	IN]	file for debugging
	IN]	line for debugging
in	reset_stop	global variable is read

### Returns

number of Bytes sent (ideal == count \* MSG\_SIZE);
0 if a block could not be sent and it was not a timeout OR **reset\_stop** was required or **hwload\_mode** is not set to "always"

\_usbsend send a logical message completely to the given device

Todo A lot of different conditions are combined in this code. Don't think, it is good in every combination...

The main task of \_usbsend () is to transfer the complete logical message from the buffer beginning with messages to count \* MSG SIZE.

According to usb 2.0 specification, a USB transmits a maximum of 64 byte user data packets. For the transmission of longer messages we need a segmentation. And that is exactly what happens here.

The message is given one by one to os\_usbsend() in MSG\_SIZE (= 64) byte large bites.

# Attention

This means that the buffer given as argument must be n \* MSG\_SIZE Byte long.

An essential constant parameter which is relevant for os\_usbsend() only is is\_recv = 0, which means sending. Now it gets a little complicated again:

- If os\_usbsend() returns 0, only zero bytes could be sent in one of the packets, or it was an error (-1 from the systemcall), but not a timeout. How many Bytes were sent in total from earlier calls does not seem to matter, \_usbsend() returns a total of 0.
- Returns os\_usbsend() -1, first check if **reset\_stop** is set globally or (incomprehensible) hwload\_mode is not set to "always". In either case, \_usbsend() returns 0, otherwise it is assumed to be a temporary transfer error and it simply retransmits the physical packet after a long delay.

• If the return value of os\_usbsend() was neither 0 nor -1, it specifies the numer of bytes transferred.

Here is an information hiding conflict with os\_usbsend() (at least in the Linux version):

If os\_usbsend() can not transfer the entire packet, errors are thrown and the number of bytes sent is returned. \_usbsend() interprets this as well and remembers the total number of bytes transferred in the local variable total\_sent. Subsequently, however, transmission is continued with the next complete MSG\_SIZE block and not with the first of the possibly missing bytes.

**Todo** Check whether this is the same in the macOS variant. It is not dramatic, but if errors occur, it can certainly irritate the devices completely if they receive incomplete data streams. Do we have errors with the messages "Wrote YY bytes (expected 64)" in the system logs? If not, we do not need to look any further.

When the last packet is transferred, <u>\_usbsend()</u> returns the effectively counted set of bytes (from **total\_sent**). This at least gives the caller the opportunity to check whether something has been lost in the middle.

A bit strange is the structure of the program: Handling the **count** MSG\_SIZE blocks to be transferred is done in the outer for (...) loop. Repeating the transfer with a treatable error is managed by the inner while(1) loop.

This must be considered when reading the code; The "break" on successful block transfer leaves the inner while, not the for (...). < Synchonization between macro and color information

            }
553
        return total sent:
555 }
```

Here is the call graph for this function:

9.42.3.5 int closeusb ( usbdevice \* kb )

#### **Parameters**

IN,OUT]	kb	
---------	----	--

### Returns

Returns 0 (everytime. No error handling is done!)

closeusb Close a USB device and remove device entry.

An imutex lock ensures first of all, that no communication is currently running from the viewpoint of the driver to the user input device (ie the virtual driver with which characters or mouse movements are sent from the daemon to the operating system as inputs).

If the **kb** has an acceptable value != 0, the index of the device is looked for and with this index os\_inputclose() is called. After this no more characters can be sent to the operating system.

Then the connection to the usb device is capped by os closeusb().

**Todo** What is not yet comprehensible is the call to updateconnected() BEFORE os\_closeusb(). Should that be in the other sequence? Or is updateconnected() not displaying the connected usb devices, but the representation which uinput devices are loaded? Questions about questions ...

If there is no valid **handle**, only updateconnected() is called. We are probably trying to disconnect a connection under construction. Not clear.

The cmd pipe as well as all open notify pipes are deleted via rmdevpath ().

This means that nothing can happen to the input path - so the device-specific imutex is unlocked again and remains unlocked.

Also the dmutex is unlocked now, but only to join the thread, which was originally taken under **kb->thread** (which started with \_setupusb()) with pthread\_join() again. Because of the closed devices that thread would have to quit sometime

See Also

the hack note with rmdevpath())

As soon as the thread is caught, the dmutex is locked again, which is what I do not understand yet: What other thread can do usb communication now?

If the vtabel exists for the given kb (why not? It seems to have race conditions here!!), via the vtable the actually device-specific, but still everywhere identical freeprofile() is called. This frees areas that are no longer needed. Then the **usbdevice** structure in its array is set to zero completely.

Error handling is rather unusual in closeusb(); Everything works (no matter what the called functions return), and closeusb() always returns zero (success).

449 }
```

Here is the call graph for this function:

Here is the caller graph for this function:

# 9.42.3.7 void\* os\_inputmain ( void \* context )

# **Parameters**

context	THE usbdevice*; Because os_inputmain() is started as a new thread, its formal parameter
	is named "context".

### Returns

null

os\_inputmain is run in a separate thread and will be detached from the main thread, so it needs to clean up its own resources.

**Todo** This function is a collection of many tasks. It should be divided into several sub-functions for the sake of greater convenience:

- 1. set up an URB (Userspace Ressource Buffer) to communicate with the USBDEVFS\_\* ioctl()s
- 2. perform the ioctl()
- 3. interpretate the information got into the URB buffer or handle error situations and retry operation or leave the endless loop
- 4. inform the os about the data
- 5. loop endless via 2.

- 6. if endless loop has gone, deinitalize the interface, free buffers etc.
- 7. return null

Here the actions in detail:

Monitor input transfers on all endpoints for non-RGB devices For RGB, monitor all but the last, as it's used for input/output

Get an usbdevfs urb data structure and clear it via memset()

Hopefully the buffer lengths are equal for all devices with congruent types. You can find out the correctness for your device with Isusb –v or similar on macOS. Currently the following combinations are known and implemented:

device	detect with macro combination	endpoint #	buffer-length
each	none	0	8
RGB Mouse	IS_RGB && IS_MOUSE	1	10
RGB Keyboard	IS_RGB && !IS_MOUSE	1	21
RGB Mouse or Keyboard	IS_RGB	2	MSG_SIZE (64)
non RGB Mouse or	!IS_RGB	1	4
Keyboard			
non RGB Mouse or	!IS_RGB	2	15
Keyboard			

Now submit all the URBs via ioctl(USBDEVFS\_SUBMITURB) with type USBDEVFS\_URB\_TYPE\_INTERRUPT (the endpoints are defined as type interrupt). Endpoint number is 0x80..0x82 or 0x83, depending on the model.

The userSpaceFS knows the URBs now, so start monitoring input

if the ioctl returns something != 0, let's have a deeper look what happened. Broken devices or shutting down the entire system leads to closing the device and finishing this thread.

If just an EPIPE ocurred, give the device a CLEAR\_HALT and resubmit the URB.

A correct REAPURB returns a Pointer to the URB which we now have a closer look into. Lock all following actions with imutex.

Process the input depending on type of device. Interprete the actual size of the URB buffer

device	detect with macro combination	seems to be endpoint #	actual buffer-length	function called
mouse (RGB and	IS_MOUSE	nA	8, 10 or 11	hid_mouse
non RGB)				translate()
mouse (RGB and	IS_MOUSE	n <b>A</b>	MSG_SIZE (64)	corsair
non RGB)				mousecopy()
RGB Keyboard	IS_RGB &&	1	8 (BIOS Mode)	hid_kb_translate()
	!IS_MOUSE			
RGB Keyboard	IS_RGB &&	2	5 or 21, KB	hid_kb_translate()
	!IS_MOUSE		inactive!	
RGB Keyboard	IS_RGB &&	3?	MSG_SIZE	corsair_kbcopy()
	!IS_MOUSE			
non RGB Keyboard	!IS_RGB &&	nA	nA	hid_kb_translate()
	!IS_MOUSE			

The input data is transformed and copied to the kb structure. Now give it to the OS and unlock the imutex afterwards.

Re-submit the URB for the next run.

If the endless loop is terminated, clean up by discarding the URBs via ioctl(USBDEVFS\_DISCARDURB), free the URB buffers and return a null pointer as thread exit code.

9.42.3.8 int os\_resetusb ( usbdevice \* kb, const char \* file, int line )

### **Parameters**

kb	THE usbdevice*

file	filename for error messages
line	line where it is called for error messages

### Returns

Returns 0 on success, -2 if device should be removed and -1 if reset should by tried again

os resetusb is the os specific implementation for resetting usb

Try to reset an usb device in a linux user space driver.

- 1. unclaim the device, but do not reconnect the system driver (second param resetting = true)
- 2. reset the device via USBDEVFS RESET command
- 3. claim the device again. Returns 0 on success, -2 if device should be removed and -1 if reset should by tried again

Todo it seems that no one wants to try the reset again. But I'v seen it somewhere...

9.42.3.10 int os\_setupusb ( usbdevice \* kb )

#### **Parameters**

kb	THE usbdevice*

#### Returns

0 on success, -1 otherwise.

os setupusb OS-specific setup for a specific usb device.

Perform the operating system-specific opening of the interface in os\_setupusb(). As a result, some parameters should be set in kb (name, serial, fwversion, epcount = number of usb endpoints), and all endpoints should be claimed with usbclaim(). Claiming is the only point where os\_setupusb() can produce an error (-1).

- · Copy device description and serial
- Copy firmware version (needed to determine USB protocol)
- · Do some output about connecting interfaces
- · Claim the USB interfaces

Todo in these modules a pullrequest is outstanding

- < Try to reset the device and recall the function
- < Don't do this endless in recursion
- < os setupusb() has a return value (used as boolean)

Here is the caller graph for this function:

9.42.3.11 int os\_usbrecv ( usbdevice \* kb, uchar \* in\_msg, const char \* file, int line )

### **Parameters**

kb	THE usbdevice*
in_msg	the buffer to fill with the message received
file	for debugging
line	for debugging

### Returns

-1 on timeout, 0 on hard error, numer of bytes received otherwise

# os\_usbrecv does what its name says:

The comment at the beginning of the procedure causes the suspicion that the firmware versionspecific distinction is missing for receiving from usb endpoint 3 or 4. The commented code contains only the reception from EP4, but this may be wrong for a software version 2.0 or higher (see the code for os-usbsend ()).

So all the receiving is done via an ioctl() like in os\_usbsend. The ioctl() is given a struct usbdevfs\_ctrltransfer, in which the relevant parameters are entered:

bRequest-	bRequest	wValue	EP	size	Timeout	data
Туре						
0xA1	0x01	0x0200	endpoint to	MSG_SIZE	5ms	the message
			be			buffer pointer
			addressed			
			from epcount			
			- 1			
Device to	1 =	specific	Interface #	64	5000	in_msg
Host,	RECEIVE?					
Type=Class,						
Recipi-						
ent=Interface						

The ioctl() returns the number of bytes received. Here is the usual check again:

- If the return value is -1 AND the error is a timeout (ETIMEOUT), os\_usbrecv() will return -1 to indicate that it is probably a recoverable problem and a retry is recommended.
- For another negative value or other error identifier OR 0 bytes are received, 0 is returned as an identifier for a heavy error.
- · In all other cases, the function returns the number of bytes received.

If this is not the entire blocksize (MSG\_SIZE bytes), an error message is issued on the standard error channel [warning "Read YY bytes (expected 64)"].

Here is the caller graph for this function:

9.42.3.12 int os\_usbsend ( usbdevice \* kb, const uchar \* out\_msg, int is\_recv, const char \* file, int line )

### **Parameters**

kb	THE usbdevice*
out_msg	the MSGSIZE char long buffer to send
is_recv	if true, just send an ioctl for further reading packets. If false, send the data at <b>out_msg</b> .
file	for debugging
line	for debugging

# Returns

-1 on timeout (try again), 0 on hard error, numer of bytes sent otherwise

os\_usbsend has two functions:

- if is\_recv == false, it tries to send a given MSG\_SIZE buffer via the usb interface given with kb.
- otherwise a request is sent via the usb device to initiate the receiving of a message from the remote device.

The functionality for sending distinguishes two cases, depending on the version number of the firmware of the connected device:

If the firmware is less or equal 1.2, the transmission is done via an ioctl(). The ioctl() is given a struct usbdevfs\_ctrltransfer, in which the relevant parameters are entered:

bRequest- Type	bRequest	wValue	EP	size	Timeout	data
0x21	0x09	0x0200	endpoint / IF to be addressed from epcount-1	MSG_SIZE	5000 (=5ms)	the message buffer pointer
Host to Device, Type=Class, Recipi- ent=Interface	9 = Send data?	specific	last or pre-last device #	64	5000	out_msg

The ioctl command is USBDEVFS\_CONTROL.

The same constellation is used if the device is requested to send its data (is\_recv = true).

For a more recent firmware and is\_recv = false, the ioctl command USBDEVFS\_CONTROL is not used (this tells the bus to enter the control mode), but the bulk method is used: USBDEVFS\_BULK. This is astonishing, because all of the endpoints are type Interrupt, not bulk.

Anyhow, forthis purpose a different structure is used for the ioctl() (struct **usbdevfs\_bulktransfer**) and this is also initialized differently:

The length and timeout parameters are given the same values as above. The formal parameter out\_msg is also passed as a buffer pointer. For the endpoints, the firmware version is differentiated again:

For a firmware version between 1.3 and <2.0 endpoint 4 is used, otherwise (it can only be >=2.0) endpoint 3 is used.

**Todo** Since the handling of endpoints has already led to problems elsewhere, this implementation is extremely hardware-dependent and critical!

Eg. the new keyboard K95PLATINUMRGB has a version number significantly less than 2.0 - will it run with this implementation?

The ioctl() - no matter what type - returns the number of bytes sent. Now comes the usual check:

- If the return value is -1 AND the error is a timeout (ETIMEOUT), os\_usbsend() will return -1 to indicate that it is probably a recoverable problem and a retry is recommended.
- For another negative value or other error identifier OR 0 bytes sent, 0 is returned as a heavy error identifier.
- In all other cases, the function returns the number of bytes sent.

If this is not the entire blocksize (MSG\_SIZE bytes), an error message is issued on the standard error channel [warning "Wrote YY bytes (expected 64)"].

If DEBUG\_USB is set during compilation, the number of bytes sent and their representation are logged to the error channel.

Here is the caller graph for this function:

9.42.3.13 const char\* product\_str ( short product )

## **Parameters**

product	is the short USB device product ID

## Returns

string to identify a type of device (see below)

product\_str returns a condensed view on what type of device we have.

At present, various models and their properties are known from corsair products. Some models differ in principle (mice and keyboards), others differ in the way they function (for example, RGB and non RGB), but they are very similar.

Here, only the first point is taken into consideration and we return a unified model string. If the model is not known with its number, *product\_str* returns an empty string.

The model numbers and corresponding strings wwith the numbers in hex-string are defined in usb.h

At present, this function is used to initialize kb->name and to give information in debug strings.

## Attention

The combinations below have to fit to the combinations in the macros mentioned above. So if you add a device with a new number, change both.

**Todo** There are macros defined in usb.h to detect all the combinations below. the only difference is the parameter: The macros need the *kb\**, product\_str() needs the *product ID*

# 9.42.3.14 int revertusb ( usbdevice \* kb )

#### **Parameters**

kb	THE usbdevice*

# Returns

0 on success or if device needs firmware upgrade, -1 otherwise

revertusb sets a given device to inactive (hardware controlled) mode if not a fw-ugrade is indicated First is checked, whether a firmware-upgrade is indicated for the device. If so, revertusb() returns 0.

**Todo** Why is this useful? Are there problems seen with deactivating a device with older fw-version??? Why isn't this an error indicating reason and we return success (0)?

Anyway, the following steps are similar to some other procs, dealing with low level usb handling:

• If we do not have an RGB device, a simple setting to Hardware-mode (NK95\_HWON) is sent to the device via n95cmd().

**Todo** The return value of nk95cmd() is ignored (but sending the ioctl may produce an error and \_nk95\_cmd will indicate this), instead revertusb() returns success in any case.

• If we have an RGB device, setactive() is called with second param active = false. That function will have a look on differences between keyboards and mice.

More precisely setactive() is just a macro to call via the kb->vtable enties either the active() or the idle() function where the vtable points to. setactive() may return error indications. If so, revertusb() returns -1, otherwise 0 in any other case.

# 9.42.3.15 void setupusb ( usbdevice \* kb )

## Attention

Lock a device's dmutex (see device.h) before accessing the USB interface.

# **Parameters**

kb	THE usbdevice* used everywhere
OUT]	kb->thread is used to store the thread ID of the fresh created thread.

setupusb starts a thread with kb as parameter and \_setupusb() as entrypoint.

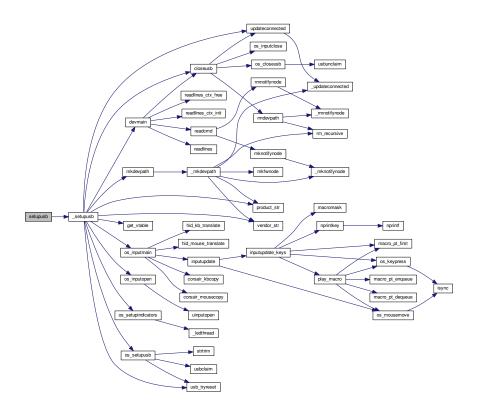

Set up a USB device after its handle is open. Spawns a new thread \_setupusb() with standard parameter kb. dmutex must be locked prior to calling this function. The function will unlock it when finished. In kb->thread the thread id is mentioned, because closeusb() needs this info for joining that thread again.

Definition at line 386 of file usb.c.

# 9.42.3.16 int usb\_tryreset ( usbdevice \* kb )

# **Parameters**

in,out	kb	THE usbdevice*
in	reset_stop	global variable is read

# Returns

0 on success, -1 otherwise

usb\_tryreset does what the name means: Try to reset the usb via resetusb()

This function is called if an usb command ran into an error in case of one of the following two situations:

• When setting up a new usb device and the start() function got an error (

See Also

```
setupusb())
```

· If upgrading to a new firmware gets an error (

See Also

```
cmd fwupdate()).
```

The previous action which got the error will NOT be re-attempted.

In an endless loop usb\_tryreset() tries to reset the given usb device via the macro resetusb().

This macro calls resetusb() with debugging information.

\_resetusb() sends a command via the operating system dependent function os\_resetusb() and - if successful - reinitializes the device. os\_resetusb() returns -2 to indicate a broken device and all structures should be removed for it.

In that case, the loop is terminated, an error message is produced and usb\_tryreset() returns -1.

In case resetusb() has success, the endless loop is left via a return 0 (success).

If the return value from resetusb() is -1, the loop is continued with the next try.

If the global variable **reset\_stop** is set directly when the function is called or after each try, **usb\_tryreset()** stops working and returns -1.

Todo Why does usb\_tryreset() hide the information returned from resetusb()? Isn't it needed by the callers?

# 9.43.3 Function Documentation

9.43.3.1 int\_nk95cmd ( usbdevice \* kb, uchar bRequest, ushort wValue, const char \* file, int line )

To send control packets to a non RGB non color K95 Keyboard, use this function. Normally it is called via the nk95cmd() macro.

If it is the wrong device for which the function is called, 0 is returned and nothing done. Otherwise a usbdevfs\_ctrltransfer structure is filled and an USBDEVFS\_CONTROL ioctl() called.

bRequest-	bRequest	wValue	EP	size	Timeout	data
Туре						
0x40	see table below to switch hardware- modus at Keyboard	wValue	device	MSG_SIZE	5ms	the message buffer pointer
Host to Device, Type=Vendor, Recipi- ent=Device	bRequest parameter	given wValue Parameter	device 0	0 data to write	5000	null

If a 0 or a negative error number is returned by the ioctl, an error message is shown depending on the error or "No data written" if retval was 0. In either case 1 is returned to indicate the error. If the ioctl returned a value > 0, 0 is returned to indicate no error.

Currently the following combinations for bRequest and wValue are used:

Device	what it might to	constant	bRequest	wValue
	do			
non RGB Keyboard	set HW-modus on	HWON	0x0002	0x0030
	(leave the ckb			
	driver)			
non RGB Keyboard	set HW-modus off	HWOFF	0x0002	0x0001
	(initialize the ckb			
	driver)			
non RGB Keyboard	set light modus M1	NK95_M1	0x0014	0x0001
	in single-color			
	keyboards			
non RGB Keyboard	set light modus M2	NK95_M2	0x0014	0x0002
	in single-color			
	keyboards			
non RGB Keyboard	set light modus M3	NK95_M3	0x0014	0x0003
	in single-color			
	keyboards

Here is the call graph for this function:

Here is the caller graph for this function:

# 9.43.3.3 void\* os\_inputmain (void \* context)

os\_inputmain is run in a separate thread and will be detached from the main thread, so it needs to clean up its own resources.

**Todo** This function is a collection of many tasks. It should be divided into several sub-functions for the sake of greater convenience:

- 1. set up an URB (Userspace Ressource Buffer) to communicate with the USBDEVFS \* ioctl()s
- 2. perform the ioctl()
- 3. interpretate the information got into the URB buffer or handle error situations and retry operation or leave the endless loop
- 4. inform the os about the data
- 5. loop endless via 2.
- 6. if endless loop has gone, deinitalize the interface, free buffers etc.
- 7. return null

Here the actions in detail:

Monitor input transfers on all endpoints for non-RGB devices For RGB, monitor all but the last, as it's used for input/output

Get an usbdevfs\_urb data structure and clear it via memset()

Hopefully the buffer lengths are equal for all devices with congruent types. You can find out the correctness for your device with Isusb –v or similar on macOS. Currently the following combinations are known and implemented:

device	detect with macro combination	endpoint #	buffer-length
each	none	0	8
RGB Mouse	IS_RGB && IS_MOUSE	1	10
RGB Keyboard	IS_RGB && !IS_MOUSE	1	21
RGB Mouse or Keyboard	IS_RGB	2	MSG_SIZE (64)
non RGB Mouse or	!IS_RGB	1	4
Keyboard			
non RGB Mouse or	!IS_RGB	2	15
Keyboard			

Now submit all the URBs via ioctl(USBDEVFS\_SUBMITURB) with type USBDEVFS\_URB\_TYPE\_INTERRUPT (the endpoints are defined as type interrupt). Endpoint number is 0x80..0x82 or 0x83, depending on the model.

The userSpaceFS knows the URBs now, so start monitoring input

if the ioctl returns something != 0, let's have a deeper look what happened. Broken devices or shutting down the entire system leads to closing the device and finishing this thread.

If just an EPIPE ocurred, give the device a CLEAR\_HALT and resubmit the URB.

A correct REAPURB returns a Pointer to the URB which we now have a closer look into. Lock all following actions with imutex.

Process the input depending on type of device. Interprete the actual size of the URB buffer

device	detect with macro combination	seems to be endpoint #	actual buffer-length	function called
mouse (RGB and non RGB)	IS_MOUSE	nA	8, 10 or 11	hid_mouse translate()
mouse (RGB and non RGB)	IS_MOUSE	nA	MSG_SIZE (64)	corsair mousecopy()
RGB Keyboard	IS_RGB && !IS_MOUSE	1	8 (BIOS Mode)	hid_kb_translate()
RGB Keyboard	IS_RGB && !IS_MOUSE	2	5 or 21, KB inactive!	hid_kb_translate()
RGB Keyboard	IS_RGB && !IS_MOUSE	3?	MSG_SIZE	corsair_kbcopy()
non RGB Keyboard	!IS_RGB && !IS_MOUSE	nA	nA	hid_kb_translate()

The input data is transformed and copied to the kb structure. Now give it to the OS and unlock the imutex afterwards.

Re-submit the URB for the next run.

If the endless loop is terminated, clean up by discarding the URBs via ioctl(USBDEVFS\_DISCARDURB), free the URB buffers and return a null pointer as thread exit code.

9.43.3.4 int os\_resetusb ( usbdevice \* kb, const char \* file, int line )

os\_resetusb is the os specific implementation for resetting usb

Try to reset an usb device in a linux user space driver.

- 1. unclaim the device, but do not reconnect the system driver (second param resetting = true)
- 2. reset the device via USBDEVFS\_RESET command
- 3. claim the device again. Returns 0 on success, -2 if device should be removed and -1 if reset should by tried again

Todo it seems that no one wants to try the reset again. But I'v seen it somewhere...

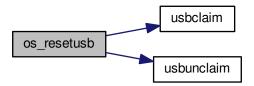

Definition at line 501 of file usb\_linux.c.

## 9.43.3.6 int os\_setupusb ( usbdevice \* kb )

os\_setupusb OS-specific setup for a specific usb device.

Perform the operating system-specific opening of the interface in os\_setupusb(). As a result, some parameters should be set in kb (name, serial, fwversion, epcount = number of usb endpoints), and all endpoints should be claimed with usbclaim(). Claiming is the only point where os\_setupusb() can produce an error (-1).

- · Copy device description and serial
- Copy firmware version (needed to determine USB protocol)
- Do some output about connecting interfaces
- · Claim the USB interfaces

Todo in these modules a pullrequest is outstanding

- < Try to reset the device and recall the function
- < Don't do this endless in recursion
- < os\_setupusb() has a return value (used as boolean)

Here is the caller graph for this function:

9.43.3.7 int os\_usbrecv ( usbdevice \* kb, uchar \* in\_msg, const char \* file, int line )

os\_usbrecv does what its name says:

The comment at the beginning of the procedure causes the suspicion that the firmware versionspecific distinction is missing for receiving from usb endpoint 3 or 4. The commented code contains only the reception from EP4, but this may be wrong for a software version 2.0 or higher (see the code for os-usbsend ()).

So all the receiving is done via an ioctl() like in os\_usbsend. The ioctl() is given a struct usbdevfs\_ctrltransfer, in which the relevant parameters are entered:

bRequest- Type	bRequest	wValue	EP	size	Timeout	data
0xA1	0x01	0x0200	endpoint to be addressed from epcount - 1	MSG_SIZE	5ms	the message buffer pointer
Device to Host, Type=Class, Recipi- ent=Interface	1 = RECEIVE?	specific	Interface #	64	5000	in_msg

The ioctl() returns the number of bytes received. Here is the usual check again:

- If the return value is -1 AND the error is a timeout (ETIMEOUT), os\_usbrecv() will return -1 to indicate that it is probably a recoverable problem and a retry is recommended.
- For another negative value or other error identifier OR 0 bytes are received, 0 is returned as an identifier for a heavy error.
- In all other cases, the function returns the number of bytes received.

If this is not the entire blocksize (MSG\_SIZE bytes), an error message is issued on the standard error channel [warning "Read YY bytes (expected 64)"].

```

Here is the caller graph for this function:

9.43.3.8 int os\_usbsend ( usbdevice \* kb, const uchar \* out\_msg, int is\_recv, const char \* file, int line )

os usbsend has two functions:

- if is recv == false, it tries to send a given MSG SIZE buffer via the usb interface given with kb.
- otherwise a request is sent via the usb device to initiate the receiving of a message from the remote device.

The functionality for sending distinguishes two cases, depending on the version number of the firmware of the connected device:

If the firmware is less or equal 1.2, the transmission is done via an ioctl(). The ioctl() is given a struct usbdevfs\_ctrltransfer, in which the relevant parameters are entered:

bRequest-	bRequest	wValue	EP	size	Timeout	data
Туре						
0x21	0x09	0x0200	endpoint / IF to be addressed from epcount-1	MSG_SIZE	5000 (=5ms)	the message buffer pointer
Host to Device, Type=Class, Recipi- ent=Interface	9 = Send data?	specific	last or pre-last device #	64	5000	out_msg

The ioctl command is USBDEVFS CONTROL.

The same constellation is used if the device is requested to send its data (is\_recv = true).

For a more recent firmware and is\_recv = false, the ioctl command USBDEVFS\_CONTROL is not used (this tells the bus to enter the control mode), but the bulk method is used: USBDEVFS\_BULK. This is astonishing, because all of the endpoints are type Interrupt, not bulk.

Anyhow, forthis purpose a different structure is used for the ioctl() (struct **usbdevfs\_bulktransfer**) and this is also initialized differently:

The length and timeout parameters are given the same values as above. The formal parameter out\_msg is also passed as a buffer pointer. For the endpoints, the firmware version is differentiated again:

For a firmware version between 1.3 and <2.0 endpoint 4 is used, otherwise (it can only be >=2.0) endpoint 3 is used.

**Todo** Since the handling of endpoints has already led to problems elsewhere, this implementation is extremely hardware-dependent and critical!

Eg. the new keyboard K95PLATINUMRGB has a version number significantly less than 2.0 - will it run with this implementation?

The ioctl() - no matter what type - returns the number of bytes sent. Now comes the usual check:

- If the return value is -1 AND the error is a timeout (ETIMEOUT), os\_usbsend() will return -1 to indicate that it is probably a recoverable problem and a retry is recommended.
- For another negative value or other error identifier OR 0 bytes sent, 0 is returned as a heavy error identifier.
- In all other cases, the function returns the number of bytes sent.

If this is not the entire blocksize (MSG\_SIZE bytes), an error message is issued on the standard error channel [warning "Wrote YY bytes (expected 64)"].

If DEBUG\_USB is set during compilation, the number of bytes sent and their representation are logged to the error channel.

```
9.43.3.10 static void udev_enum( ) [static]
```

Reduce the hits of the enumeration by limiting to usb as technology and corsair as idVendor. Then filter with udev\_enumerate\_scan\_devices () all hits.

The following call to udev\_enumerate\_get\_list\_entry() fetches the entire hitlist as udev\_list\_entry \*.

Use udev\_list\_entry\_foreach() to iterate through the hit set.

If both the device name exists (udev\_list\_entry\_get\_name) and the subsequent creation of a new udev\_device (udev\_device\_new\_from\_syspath) is ok, the new device is added to the list with usb\_add\_device().

If the latter does not work, the new device is released again (udev\_device\_unref ()).

After the last iteration, the enumerator is released with udev enumerate unref ().

9.43.3.11 static int usb\_add\_device ( struct udev\_device \* dev ) [static]

If the device id can be found, call usbadd() with the appropriate parameters.

## **Parameters**

dev	the functions usb_*_device get a struct udev* with the neccessary hardware-related infor-
	mation.

## Returns

the retval of usbadd() or 1 if either vendor is not corsair or product is not mentioned in model[].

First get the idVendor via udev\_device\_get\_sysattr\_value(). If this is equal to the ID-string of corsair ("1b1c"), get the idProduct on the same way.

If we can find the model name in the model array, call usbadd() with the model number.

**Todo** So why the hell not a transformation between the string and the short presentation? Lets check if the string representation is used elsewhere.

9.43.3.17 static int usbunclaim ( usbdevice \* kb, int resetting ) [static]

usbunclaim do an unclaiming of the usb device gicen by kb.

## **Parameters**

kb	THE usbdevice*
resetting	boolean flag: If resseting is true, the caller will perform a bus reset command after unclaiming
	the device.

# Returns

always 0.

Unclaim all endpoints for a given device (remeber the decrementing of the file descriptor) via ioctl(USBDEVFS\_DISCARDURB).

Afterwards - if ressetting is false - do a USBDEVFS\_CONNECT for EP 0 and 1. If it is a non RGB device, connect EP 2 also. The comment mentions RGB keyboards only, but as I understand the code, this is valid also for RGB mice

There is no error handling yet. Function is called in usb\_linux.c only, so it is declared as static now.
